KEF-2016: Reforms for Inclusive Growth

November 3–4, 2016

On the verge of the new economic cycle – how to set up for the failure, and how not to

Andrey Movchan, Senior Associate and Director of the Economic Policy Program, Carnegie Moscow Center

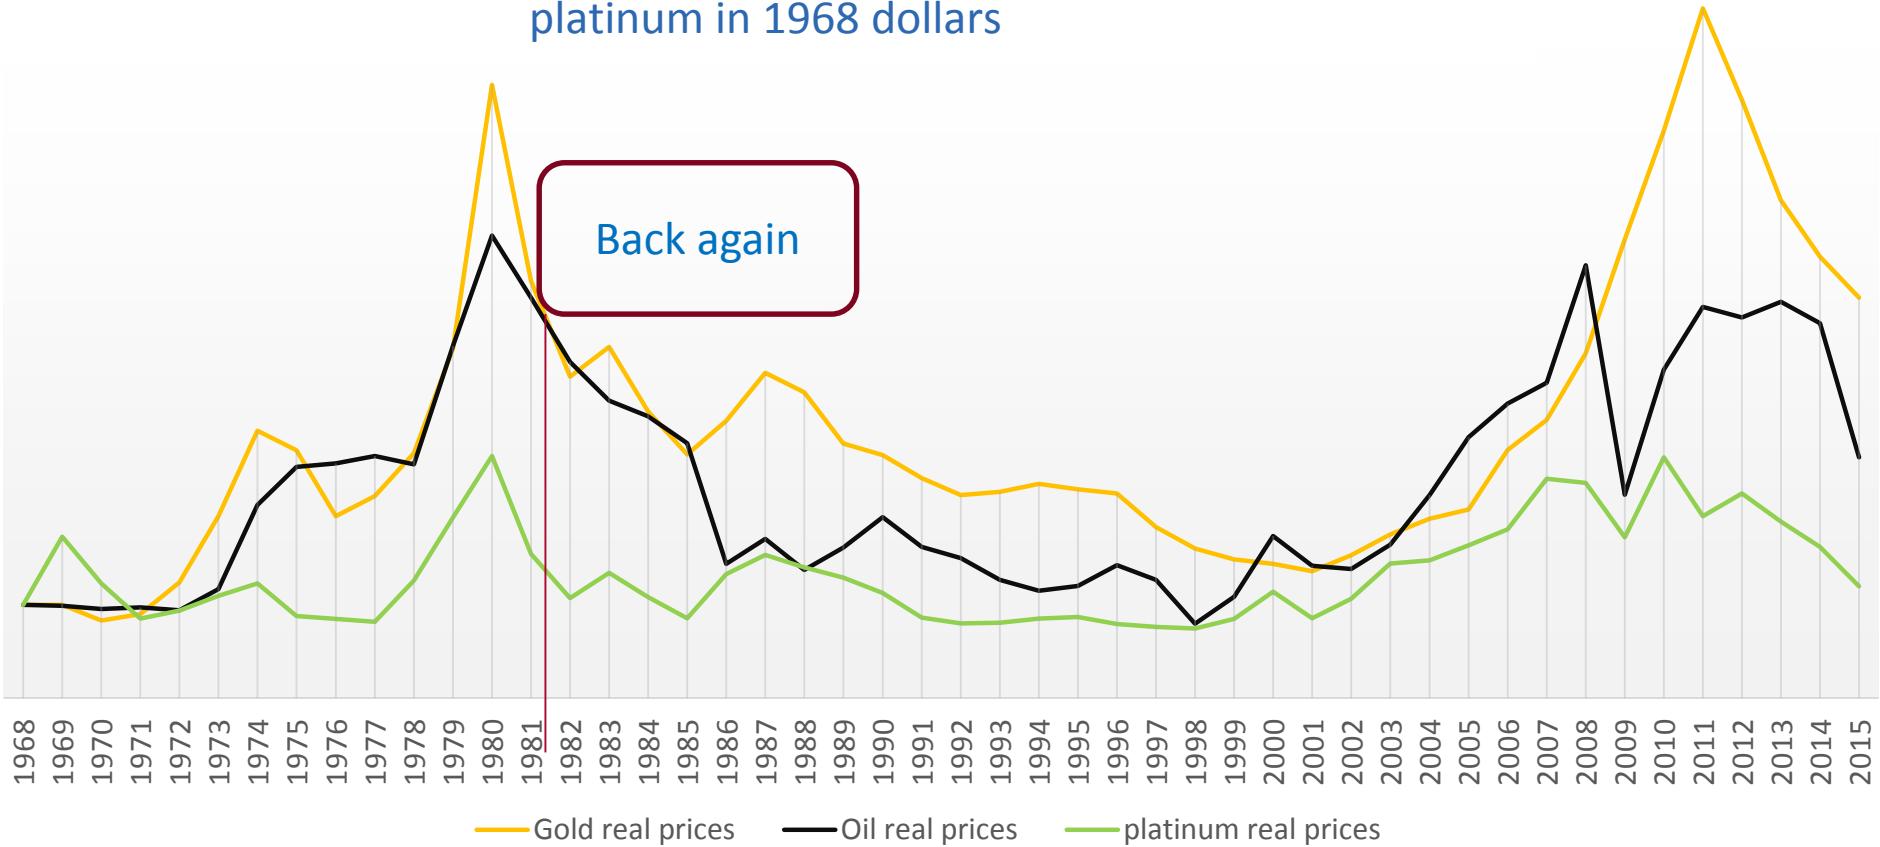

On the verge of the new economic cycle – how to set up for failure and how not to

Andrey Movchan. 3/11/16.

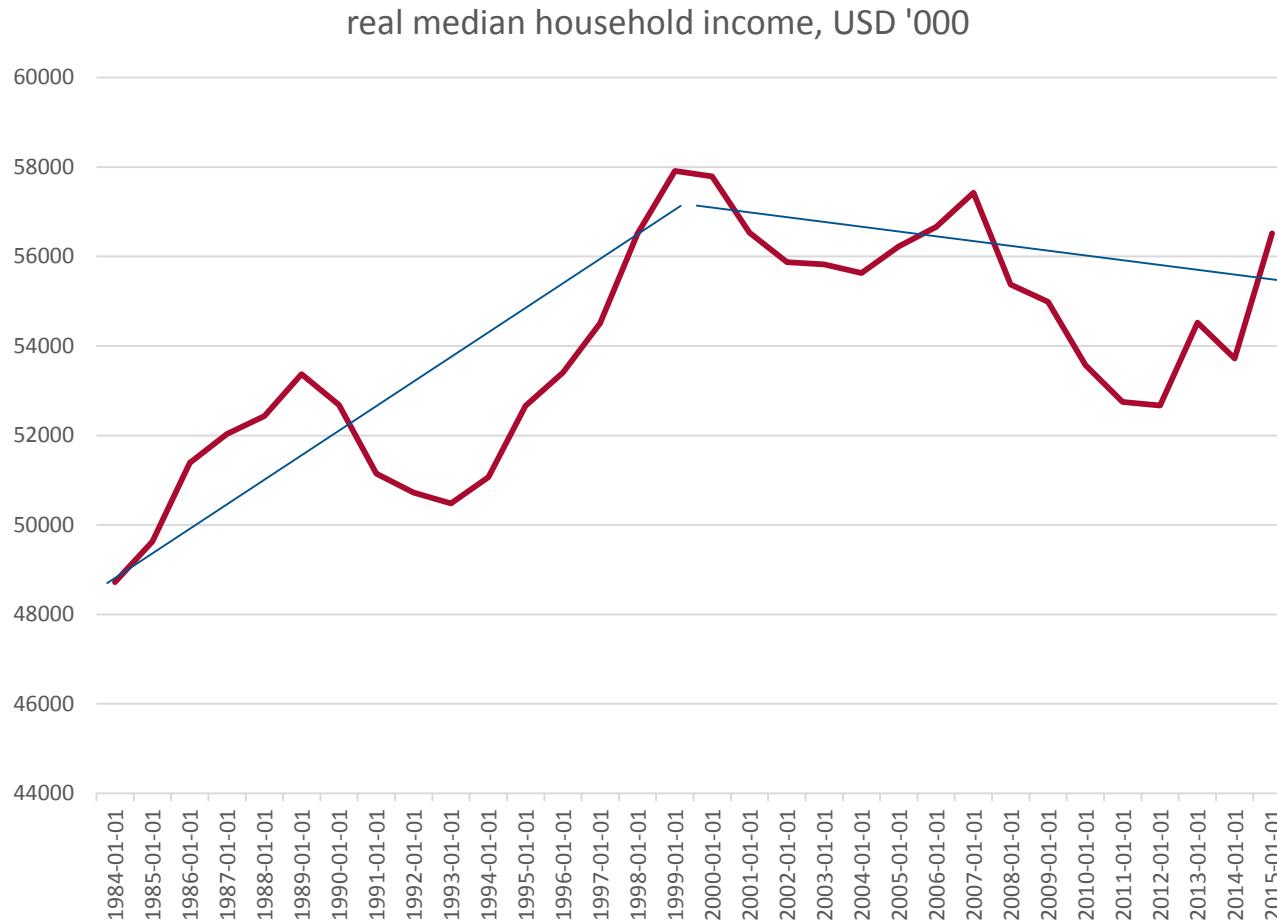

Where is the cycle? - In commodities

8 Inflation adjusted, normalized to 1 as of Y1968, prices of crude oil, gold and platinum in 1968 dollars

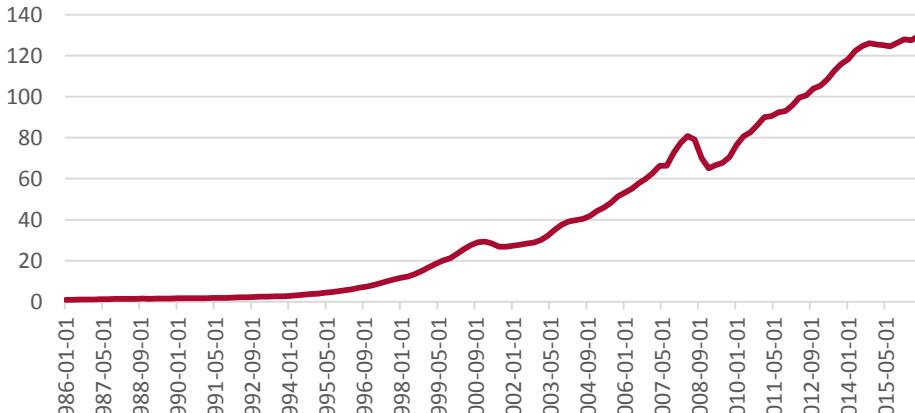

Another cycle indicator

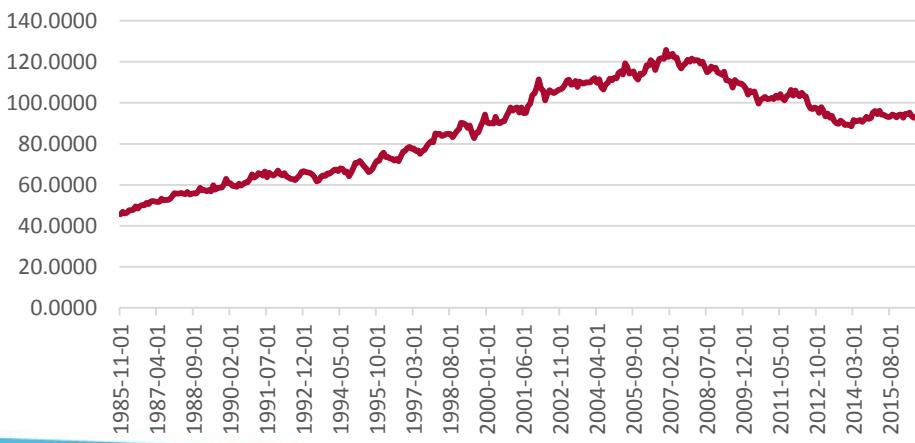

Production stagnates since 1998-2000

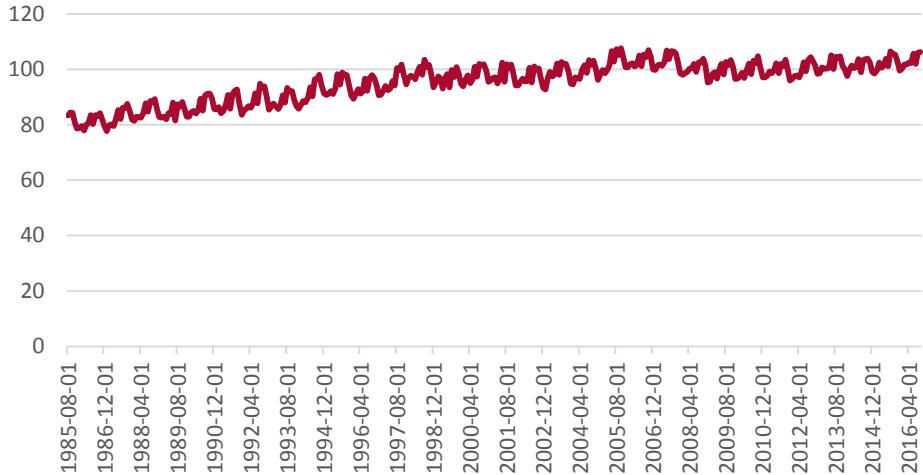

Production of computer equipment, 2012 = 100,
the US

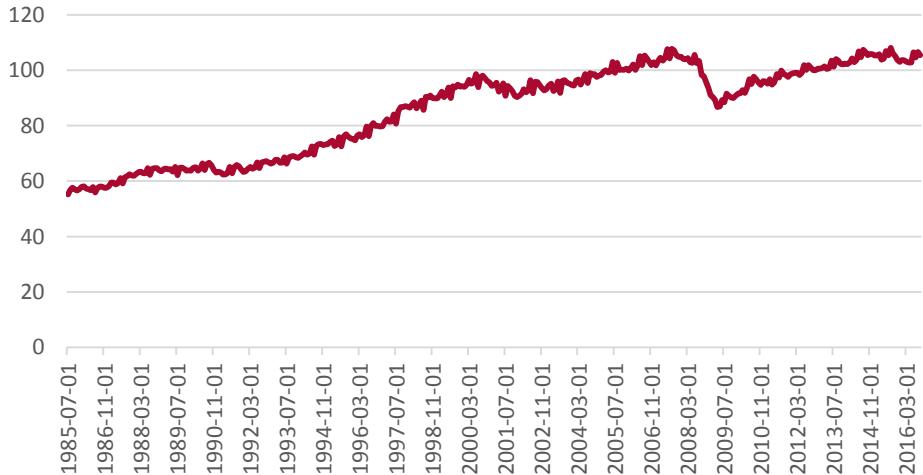

Production of medical and pharm, 2012 = 100,
the US

Production of food and bev, 2012 = 100, the US

Production total, 2012 = 100, the US

Monetary policy is inefficient – since 1997

M2 velocity, the US

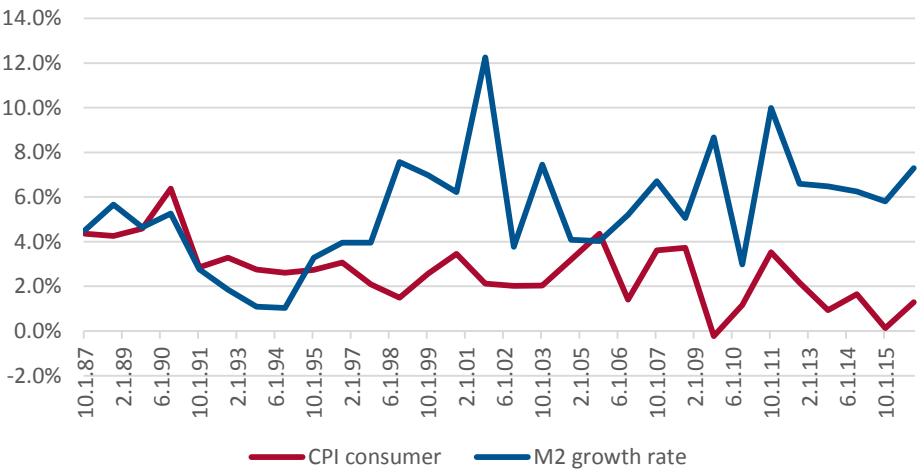

3 month real interest rates

real deposits growth rate

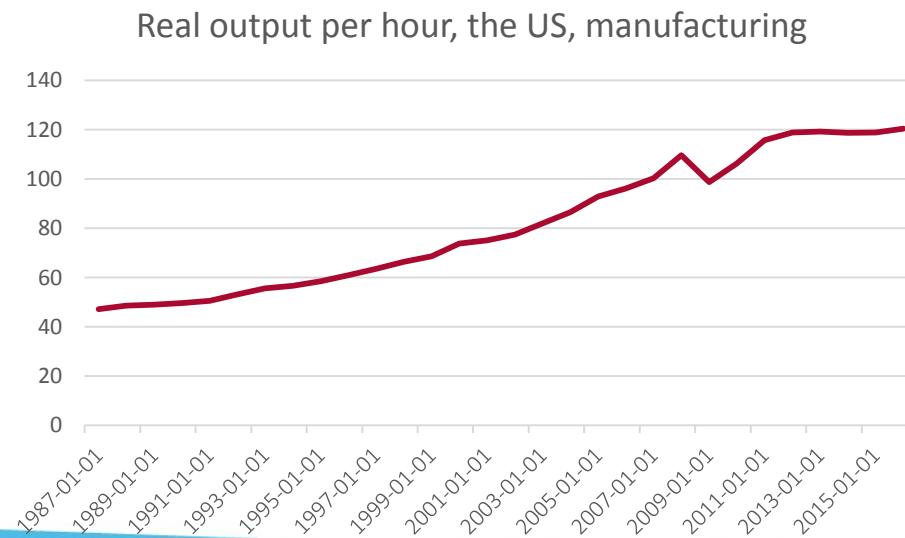

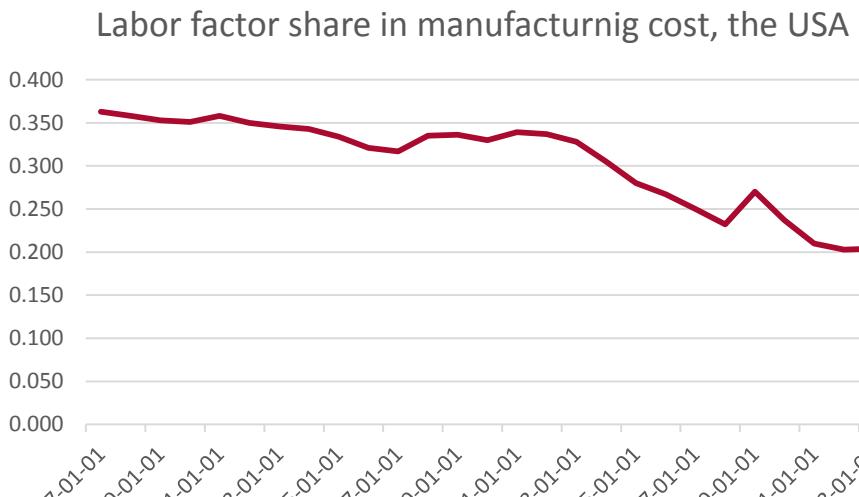

M2 growth rate and CPI, the US

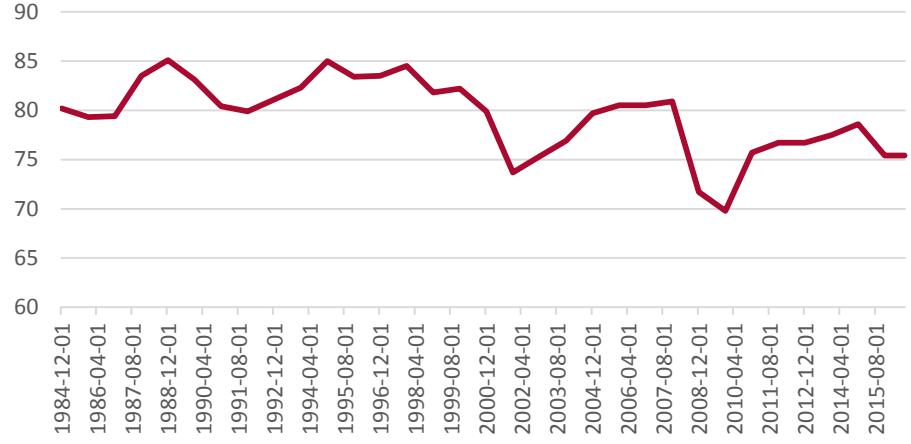

Labor intensity was the driver,

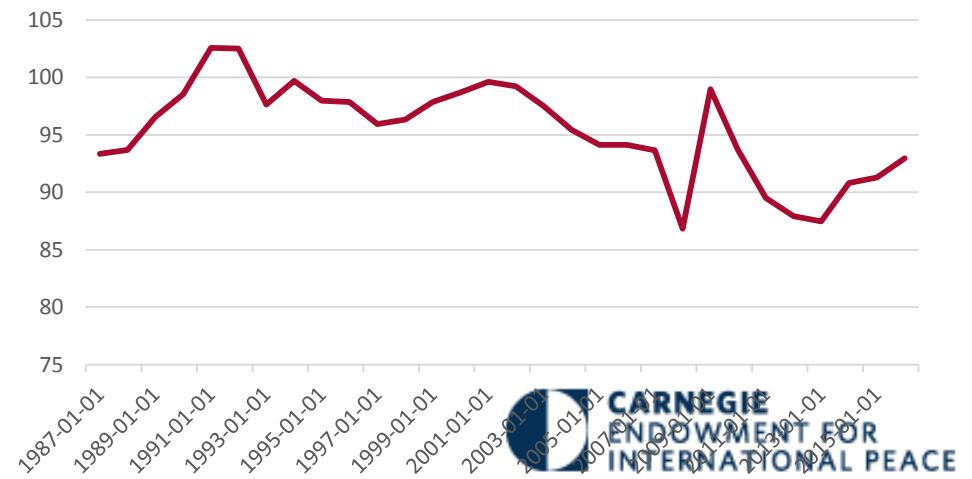

but not any more

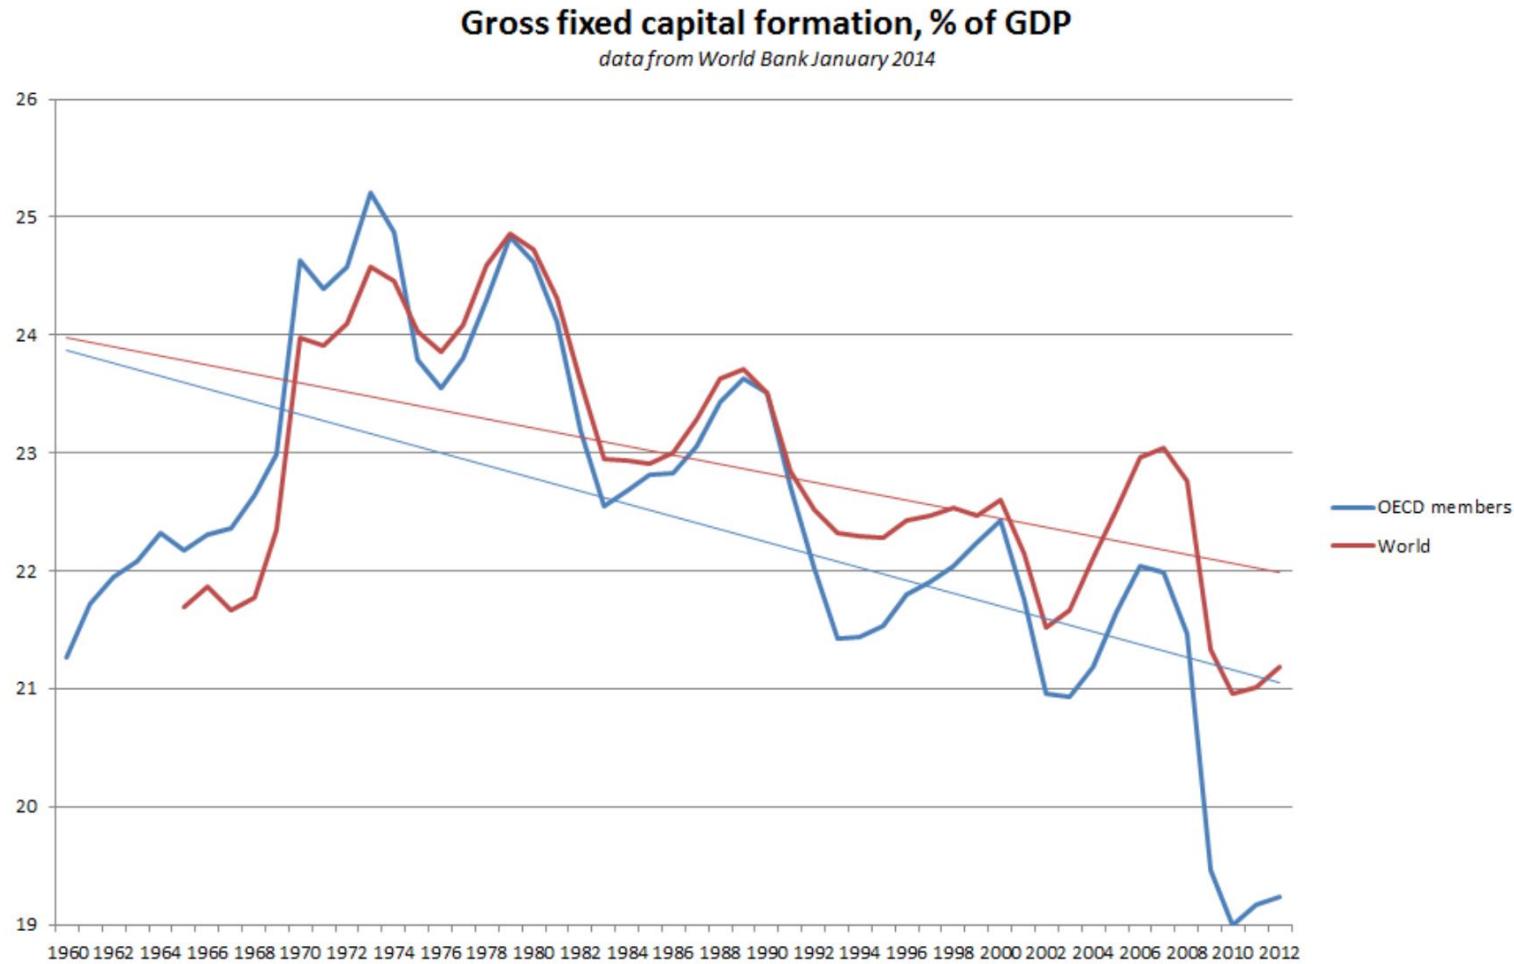

The US industrial capacity utilization, %

Real unit labor cost index, the US

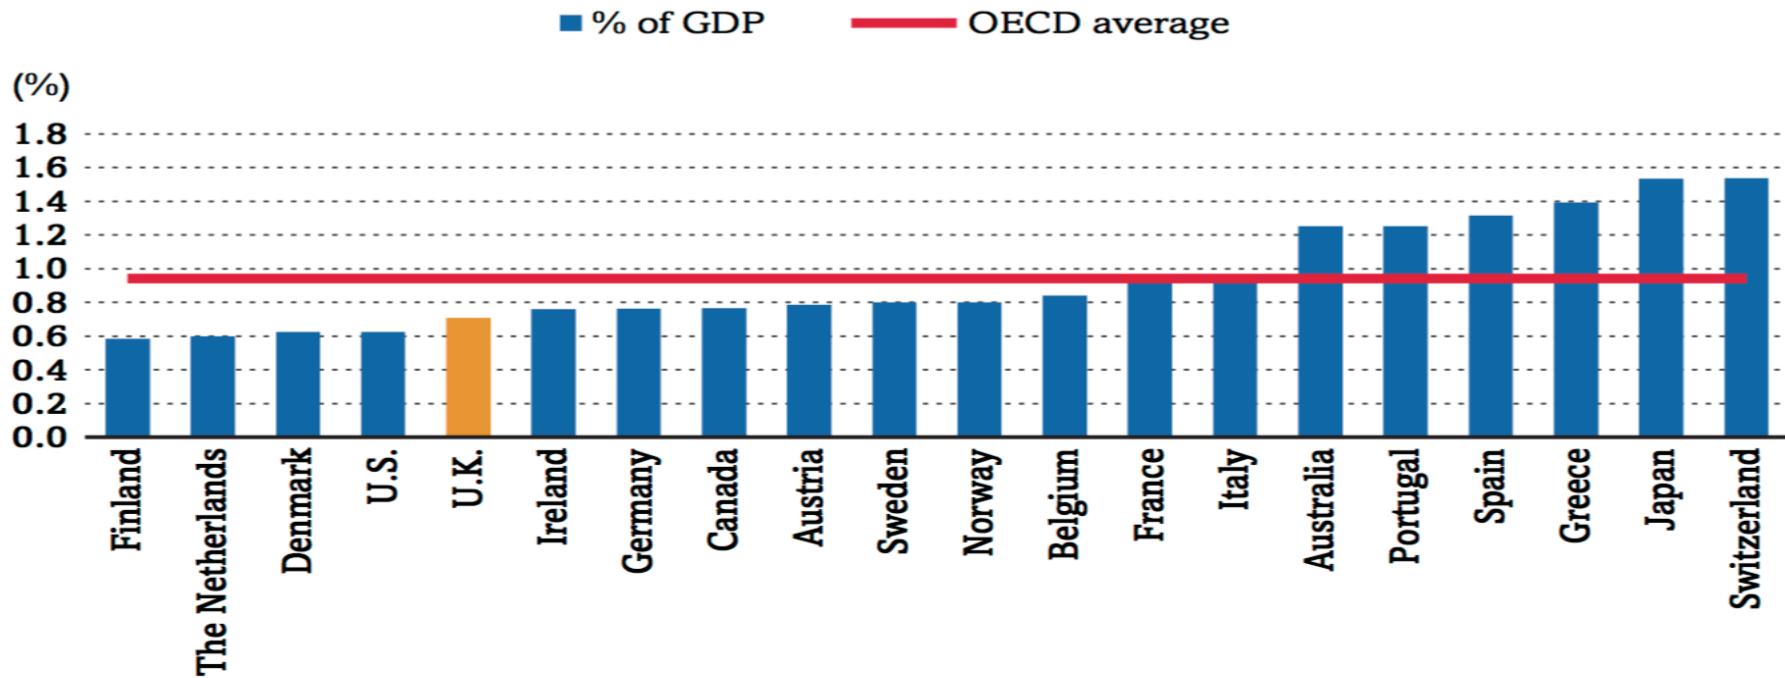

Fixed capital points at the end of cycle

Infrastructure investments do not help any more

Chart 2 | Average Transportation Infrastructure Investment In 1995 To 2011

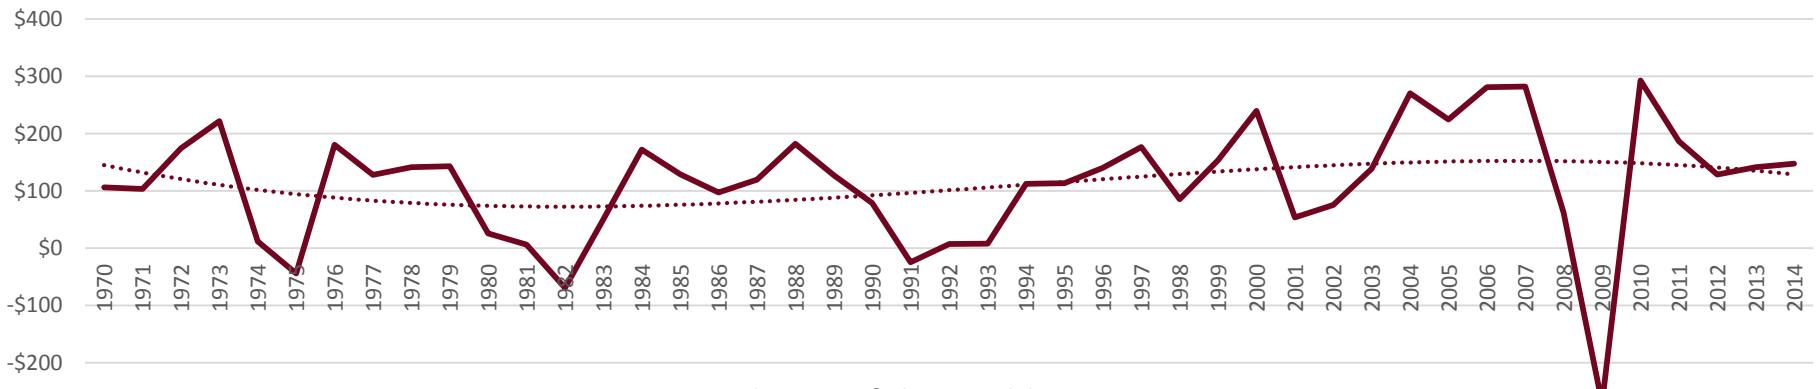

OECD—Organisation for Economic Co-operation and Development.

Sources: International Transport Forum, Standard & Poor's calculations.

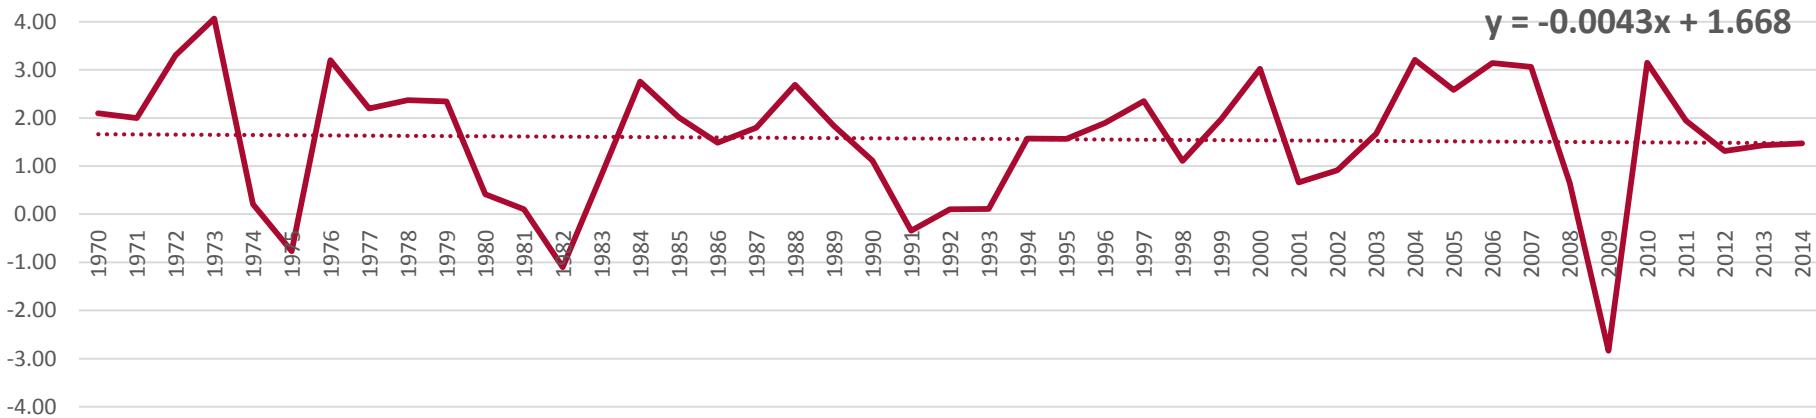

© Standard & Poor's 2014.

However the global GDP growth is rather stable

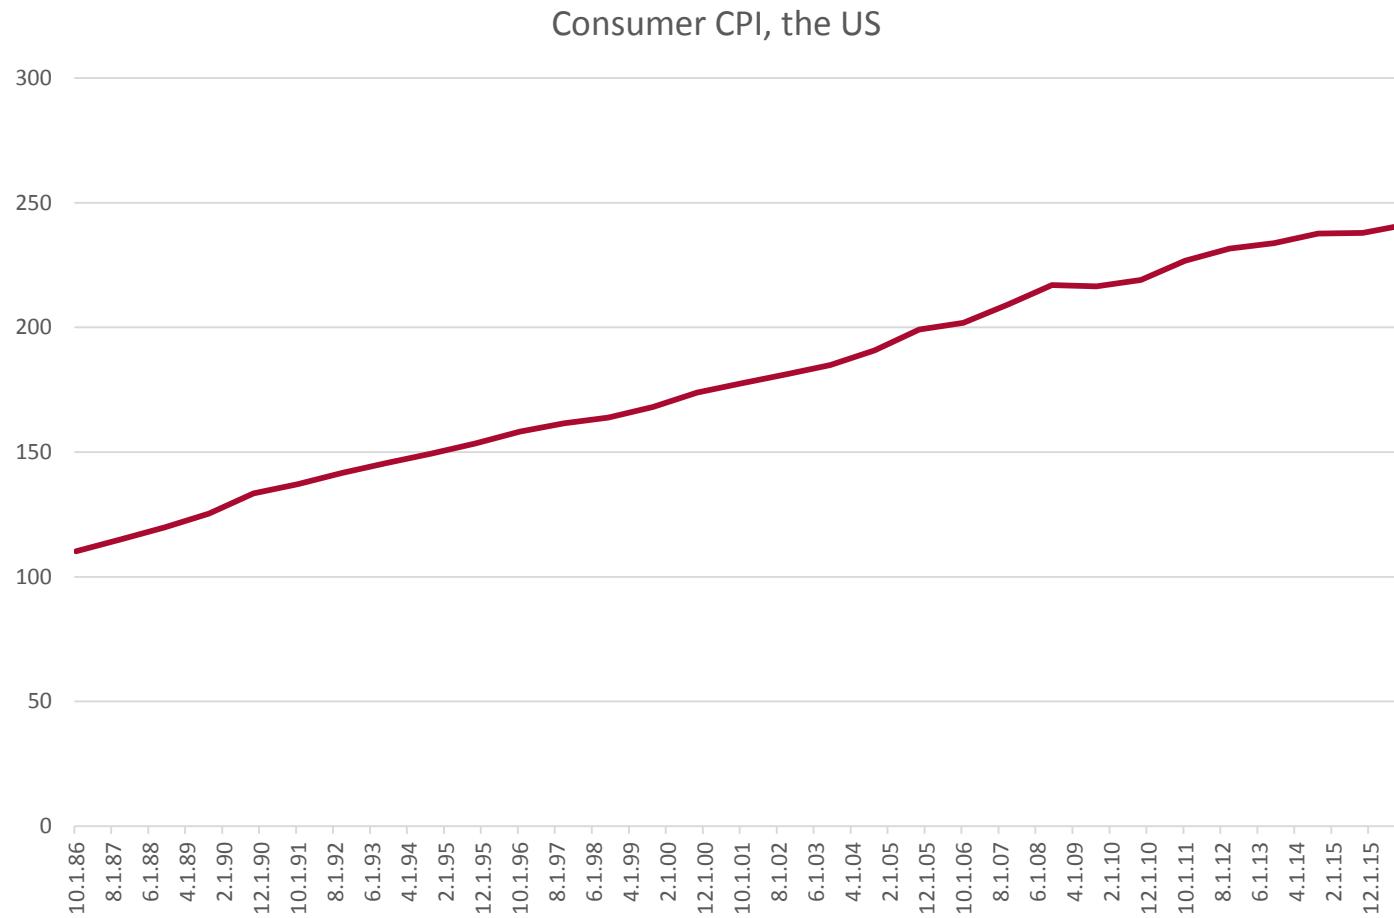

Annual growth of world GDP in 2010 dollars

A growth rate of the world GDP in %

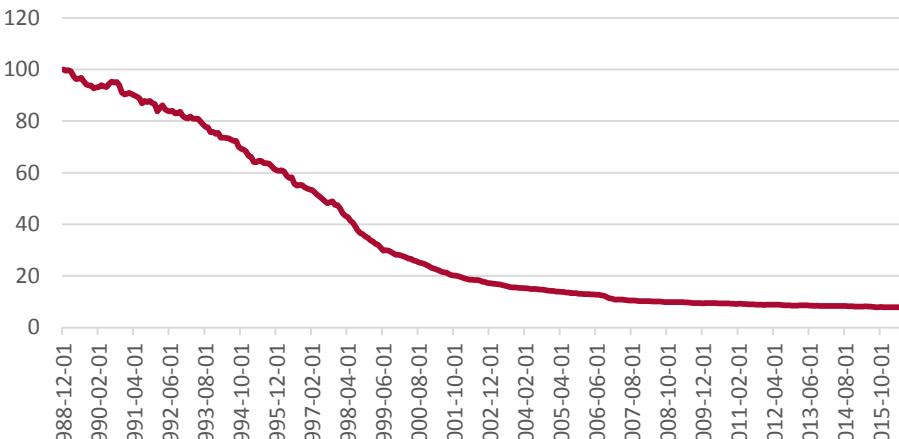

CPI growth looks quite linear also

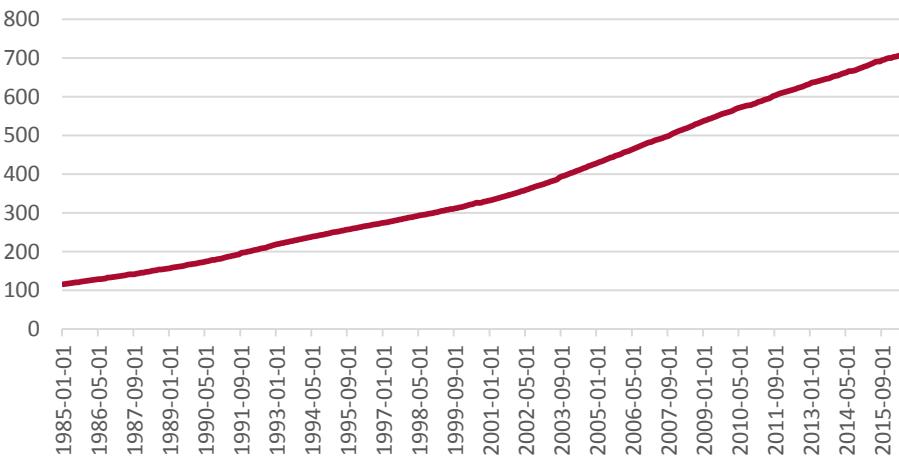

Although CPI per industry is not

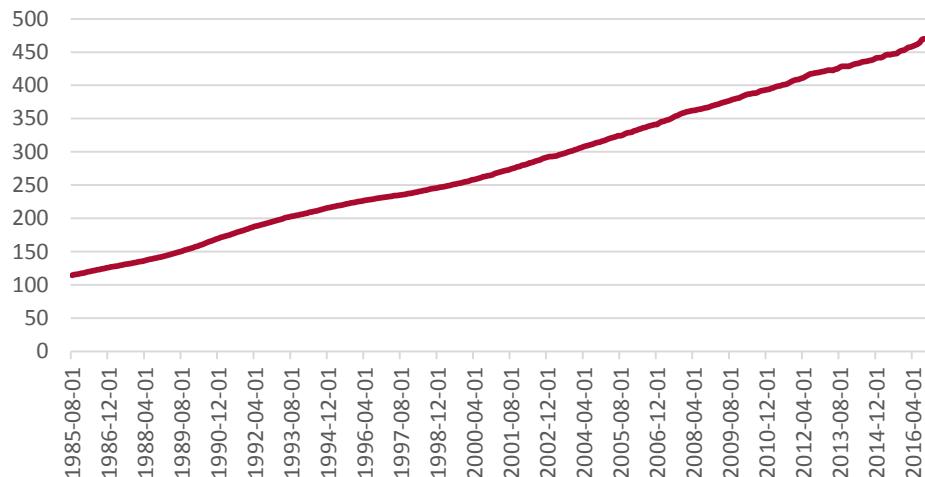

CPI high tech equipment, the US

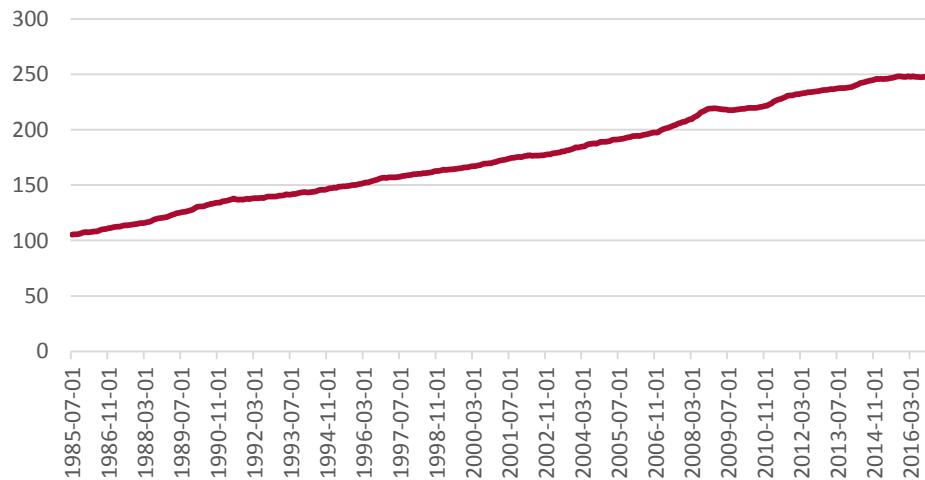

CPI education, the US

CPI medical services, the US

CPI food and bev, the US

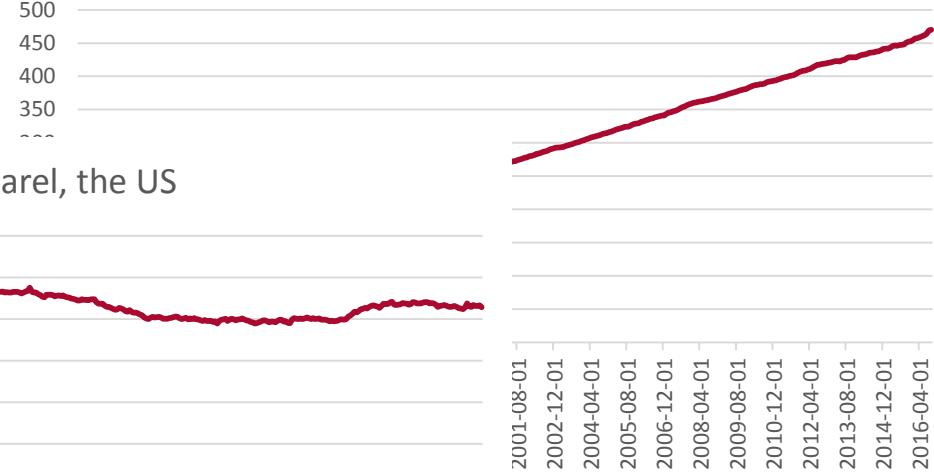

And even sometimes flat

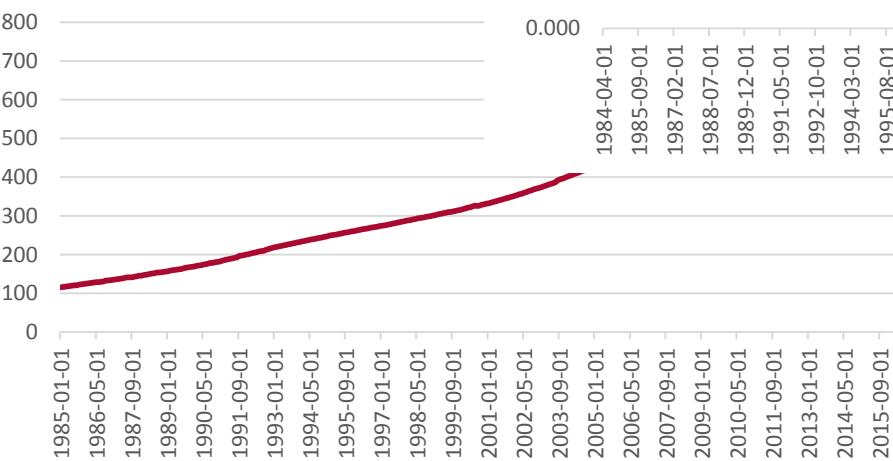

CPI high tech equipment, the US

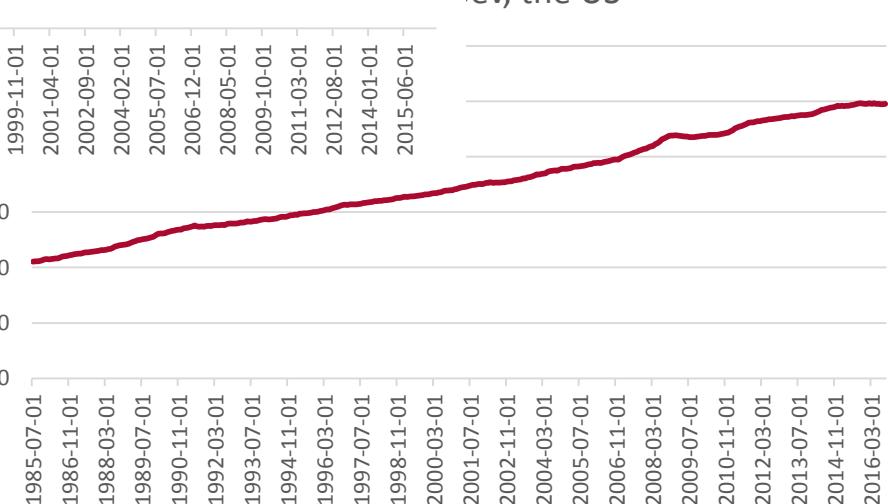

CPI medical services, the US

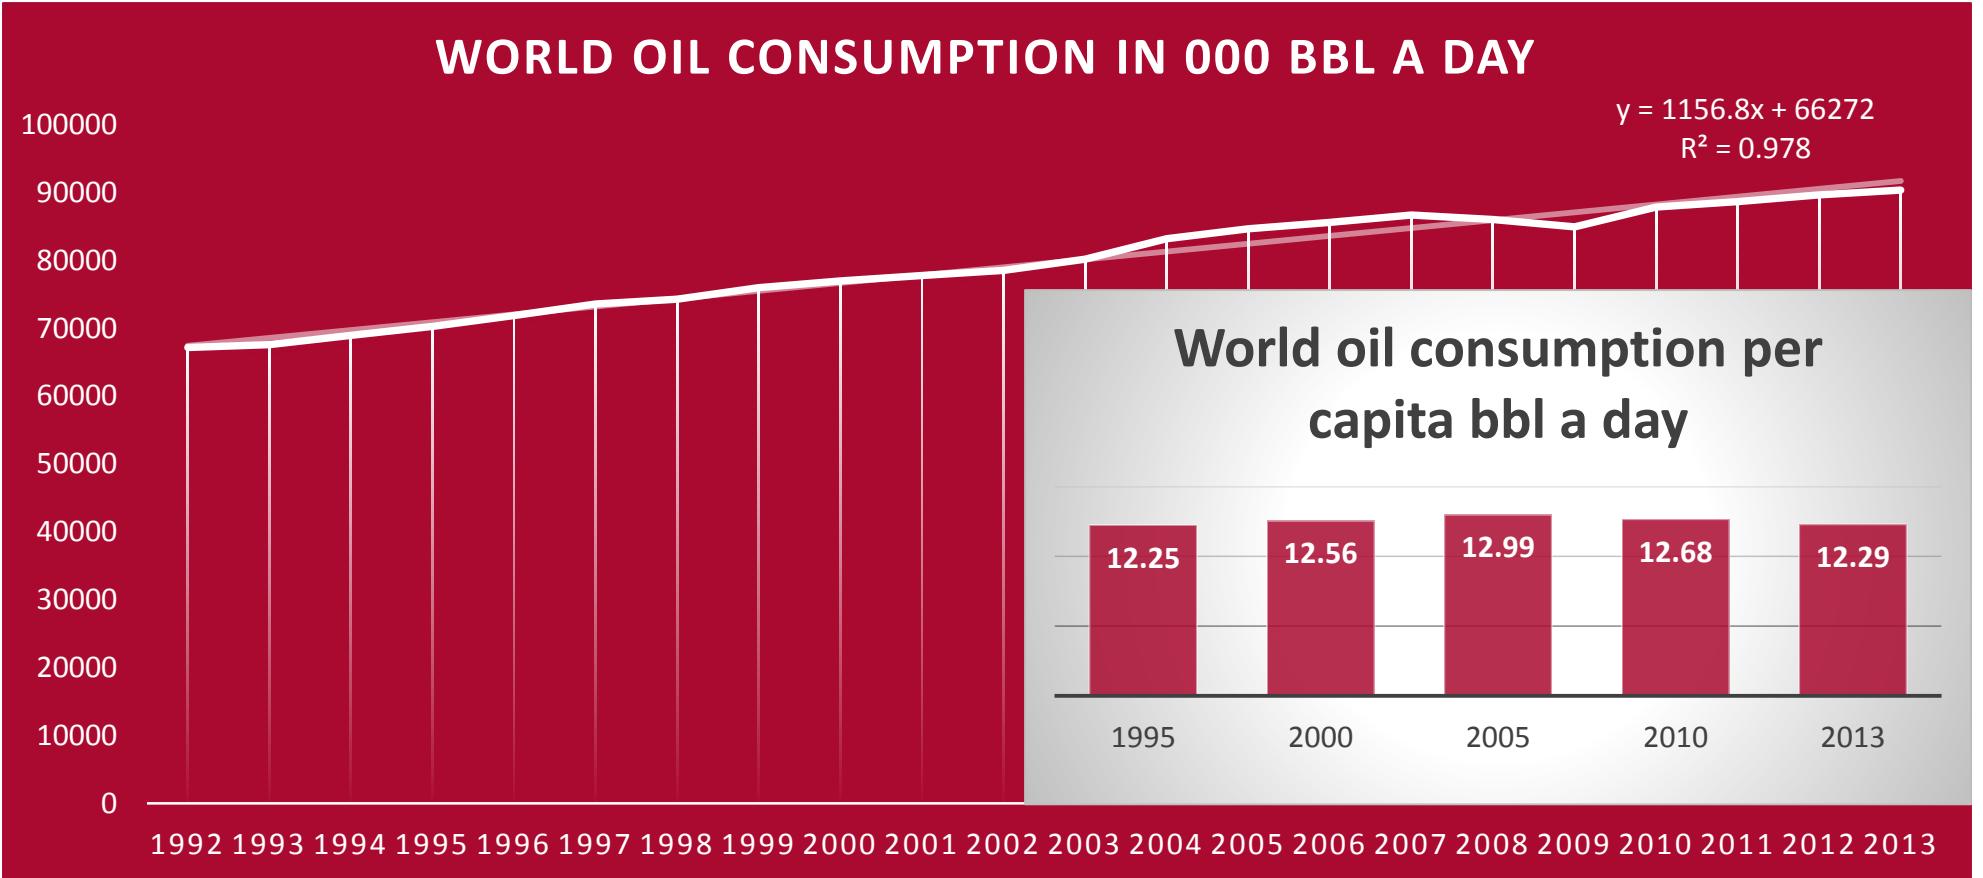

CPI education

CPI apparel, the US

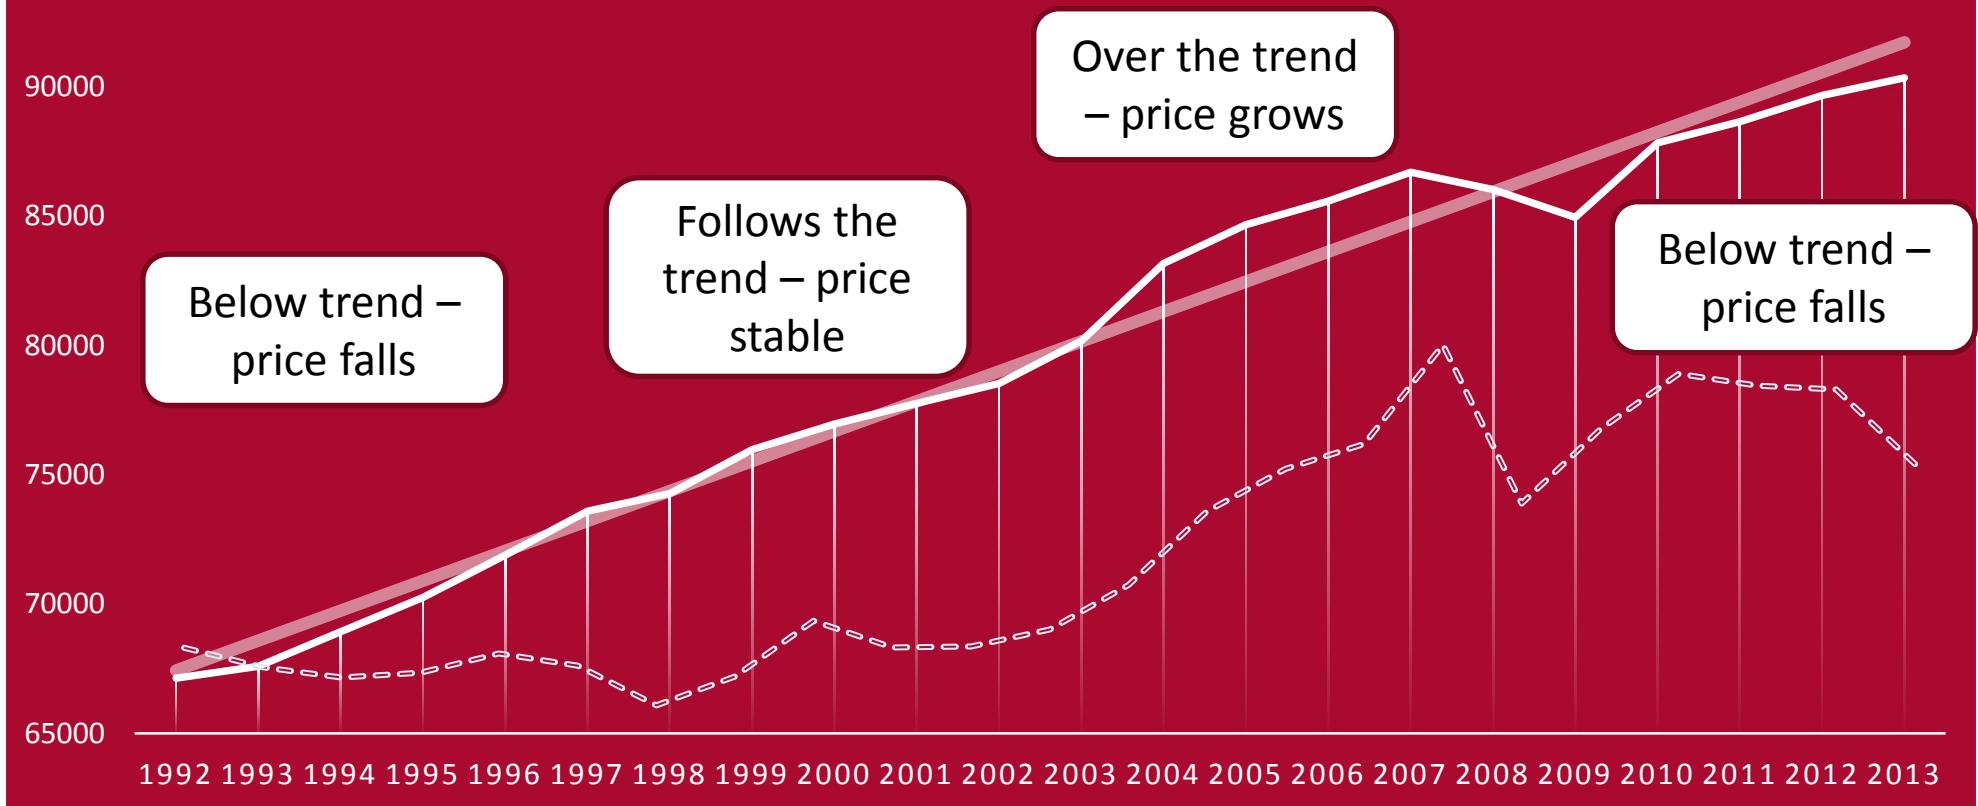

Oil consumption is driven by population size

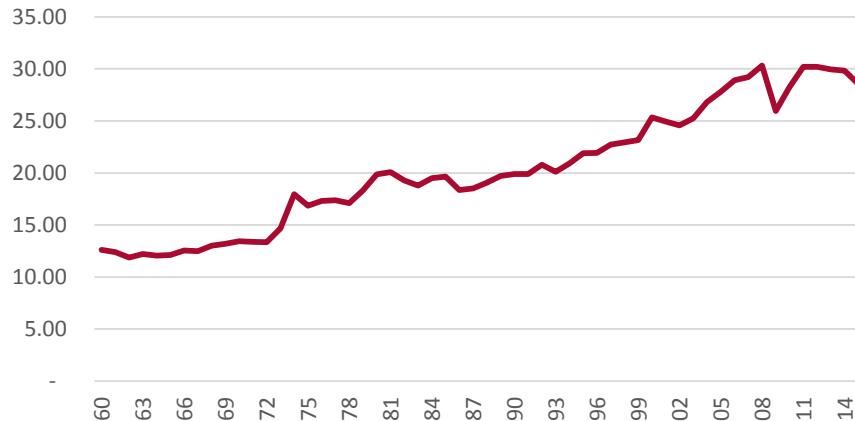

And the price driven by rather small changes
in consumption

WORLD OIL CONSUMPTION IN 000 BBL A DAY

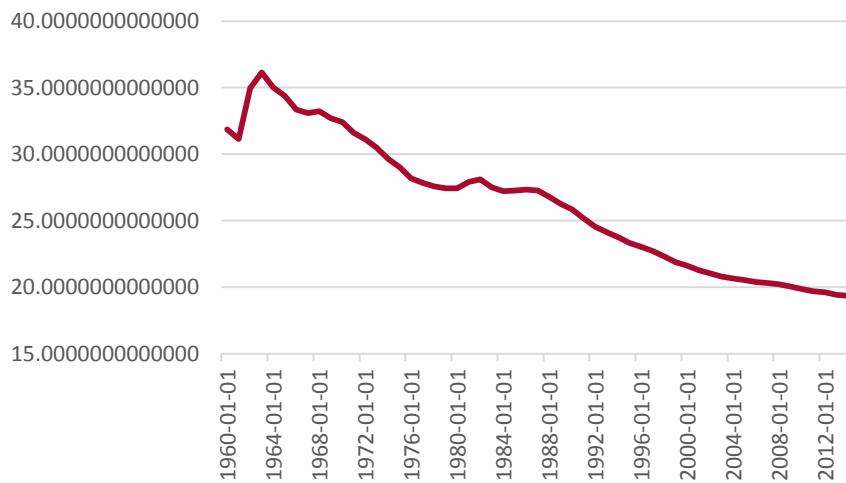

Four major trends that persist through cycle

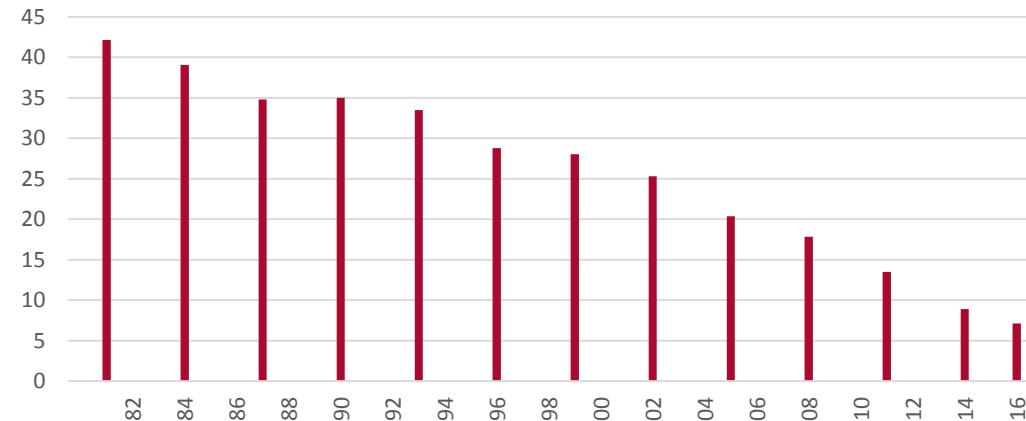

SHARE OF IMPORTS IN GDP, WORLD, %

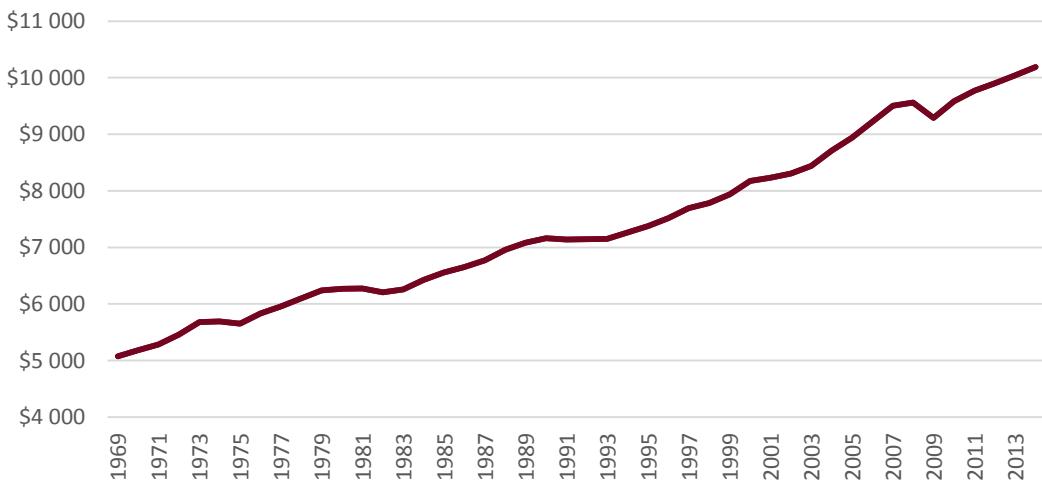

CRUDE BIRTH RATE, WORLD, PER '000

POVERTY RATE IN %%, WORLD

REAL GDP PER CAPITA IN 2010 USD, WORLD

The composition of value chain has changed dramatically

parameter	1990	2015	change
↑ trade as % of GDP	38	59	55%
↑ imports as % of GDP	19,3	28,1	46%
↓ gross savings as % of GDP	22,3	19,9	-11%
↑ government consumption as % of GDP	16,8	18,6	11%
↑ household consumption as % of GDP	60	61,6	3%
↓ fixed capital formation as % of GDP	22,6	19,4	-14%
↓ agriculture AV % of GDP	5,4	2,8	-48%
↓ manufacturing AV %% of GDP	18,8	16,7	-11%
↓ non manufacturing industry AV % of GDP	14,4	9,6	-33%
↑ services AV % of GDP	61,4	70,9	15%

Few nations will grow the stock of consumers

Migration does not affect the picture any more

Migration per
year

The EU ~ 2 mln

MENA ~ 0

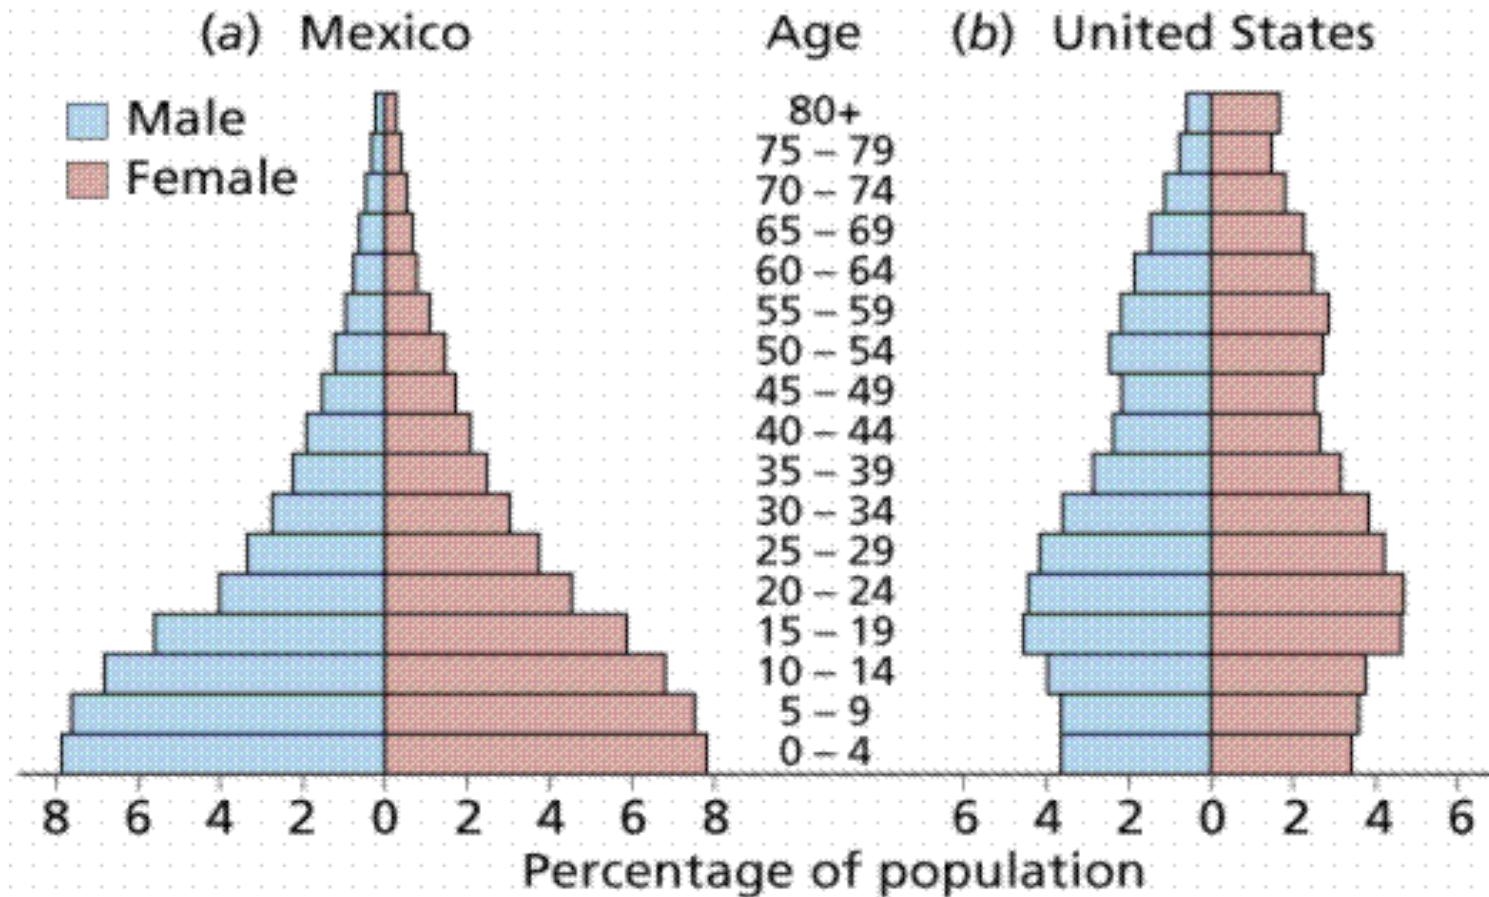

SSA ~ - 1 mln

The US ~ 0,5 mln

LatAm ~ - 0,5
mln

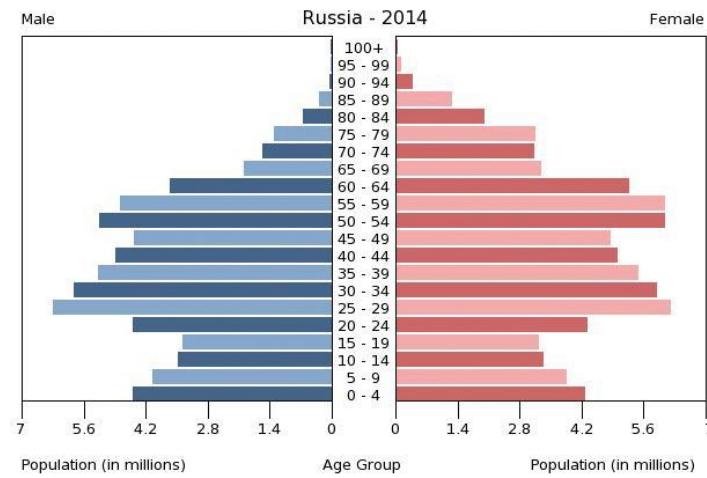

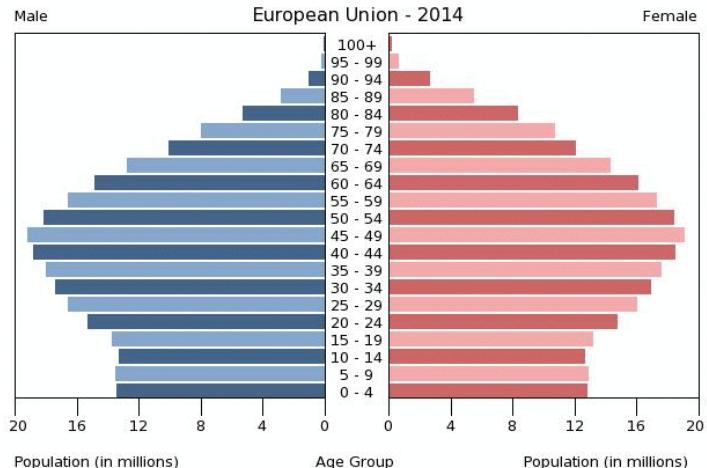

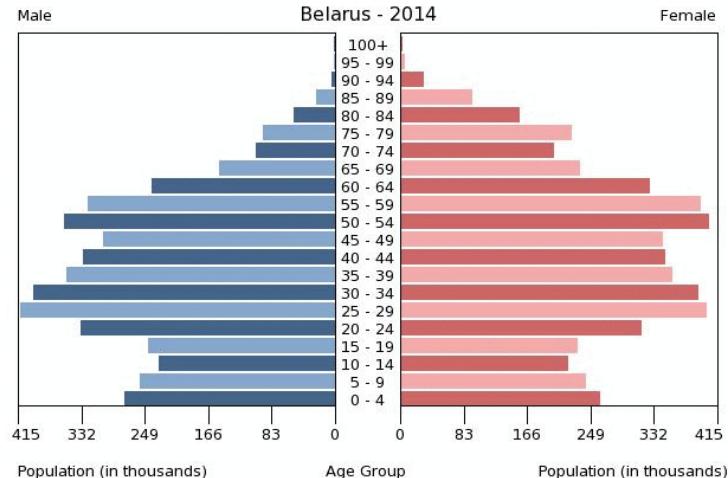

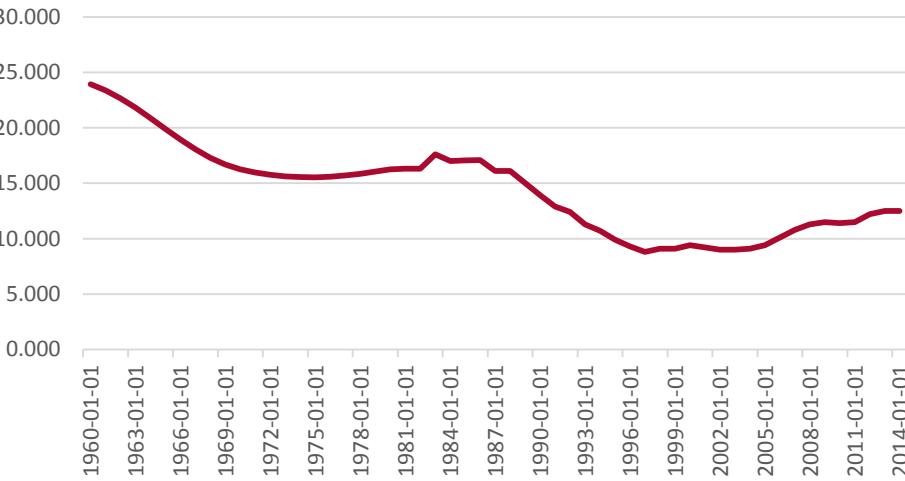

EMEA ~ 0

Russia ~ 0

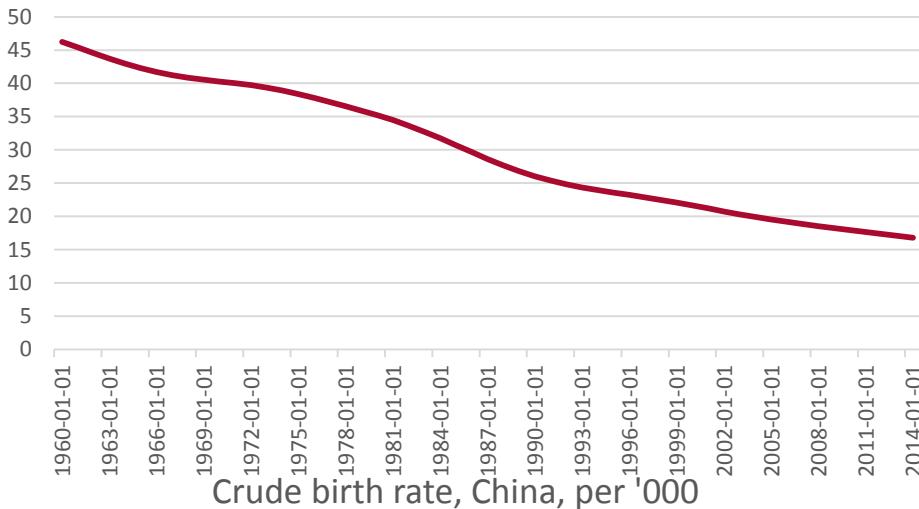

Great internal consumers/producers loss is ahead

CRUDE BIRTH RATE, BELARUS, PER '000

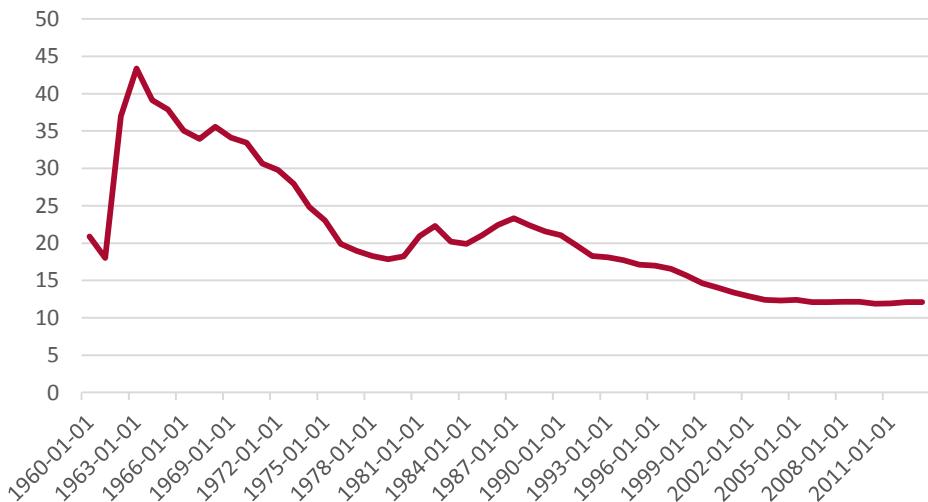

And in almost all countries

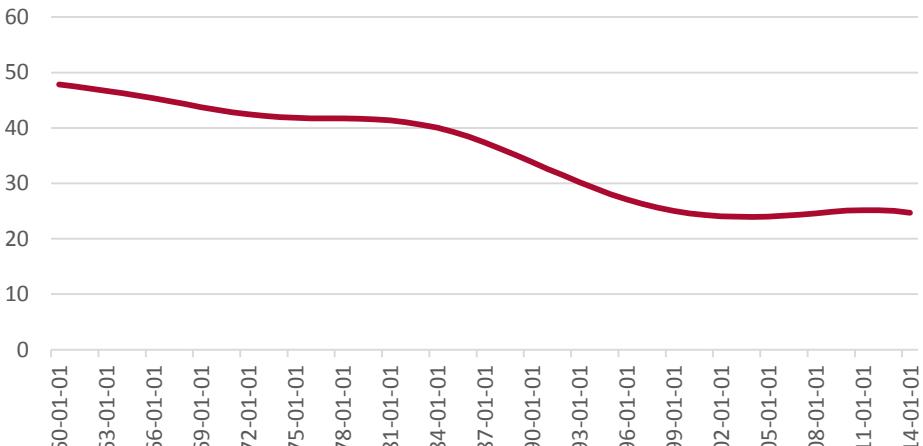

Crude birth rate, Turkey, per '000

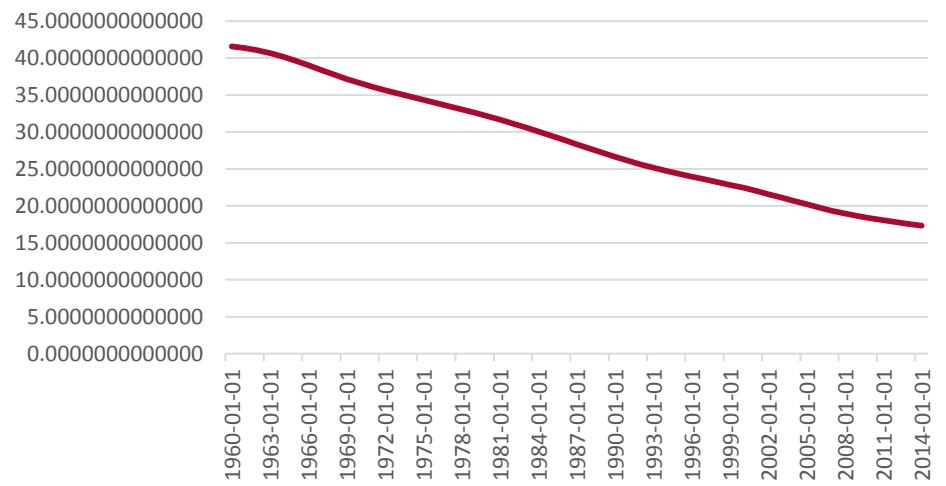

Crude birth rate, China, per '000

Crude birth rate, MENA, per '000

Crude birth rate, LatAm, per '000

End of cycle ideas

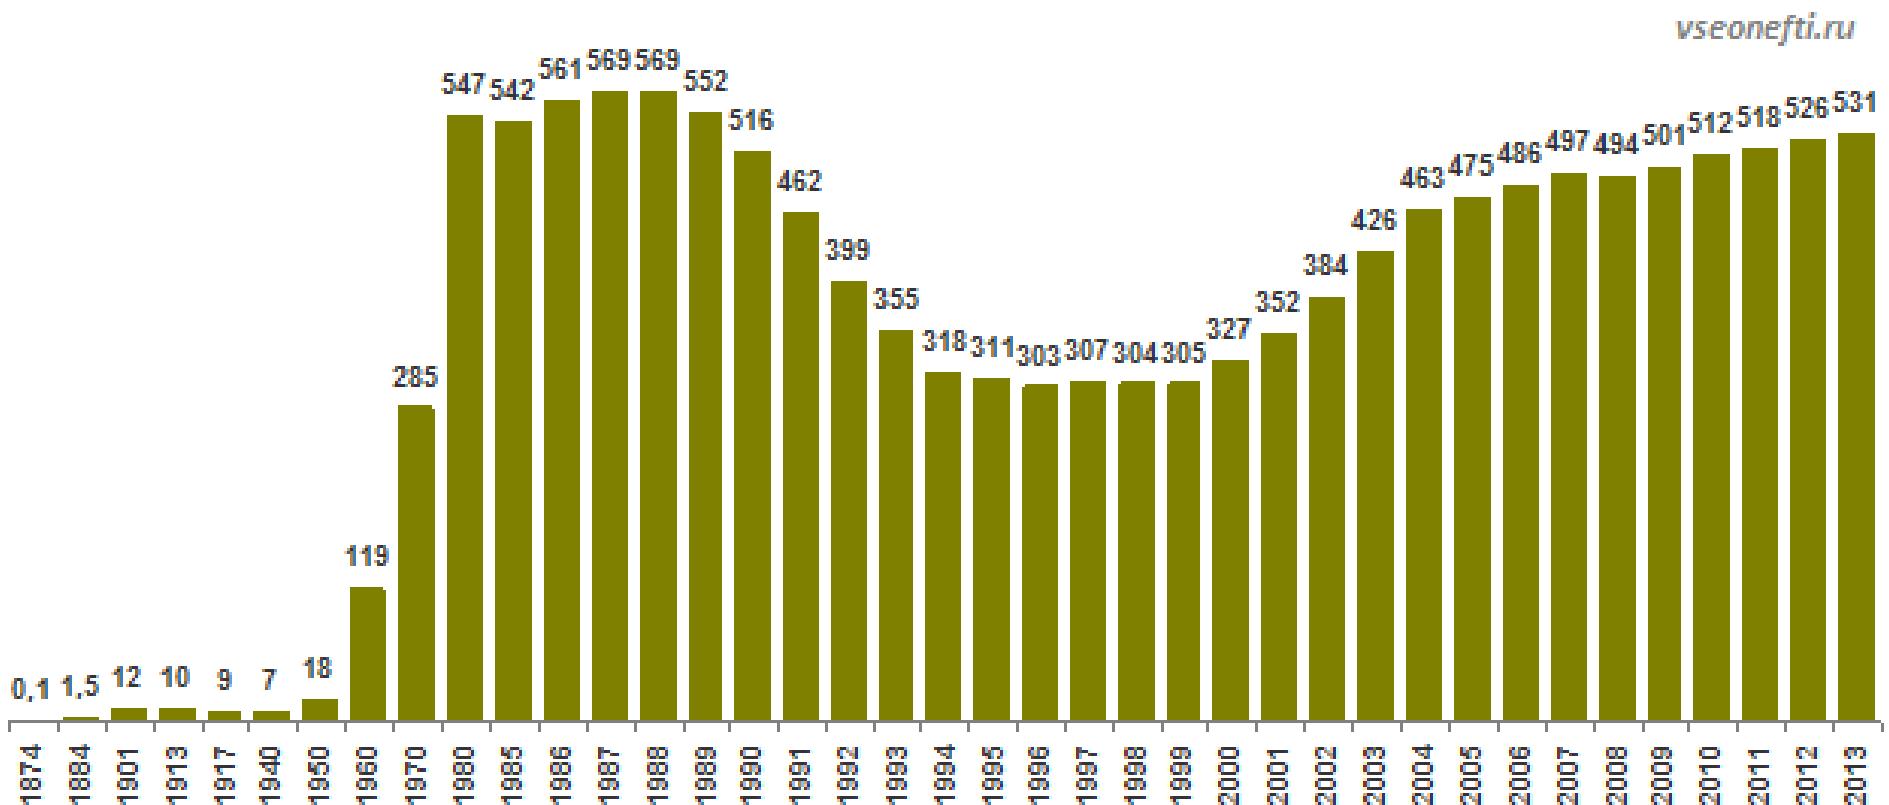

- Three major facts determine the mid term future of the global economy:
 - The number of active consumers will decrease;
 - There will be no brand new growth trigger;
 - The number of passive consumers will increase.
- Oil price, migration, current account disbalances – are false agenda
- Through next years the oversupply of money will persist;
 - Do not confuse it with budget revenues!
- We are in the best times for borrowing ever
- Added value migrates into marketing and R&D, but more into marketing
- Trade share of GDP grows – barriers become problems for the builders
- For all countries domestic markets become insufficient

Russia – bad start, gloomy perspective

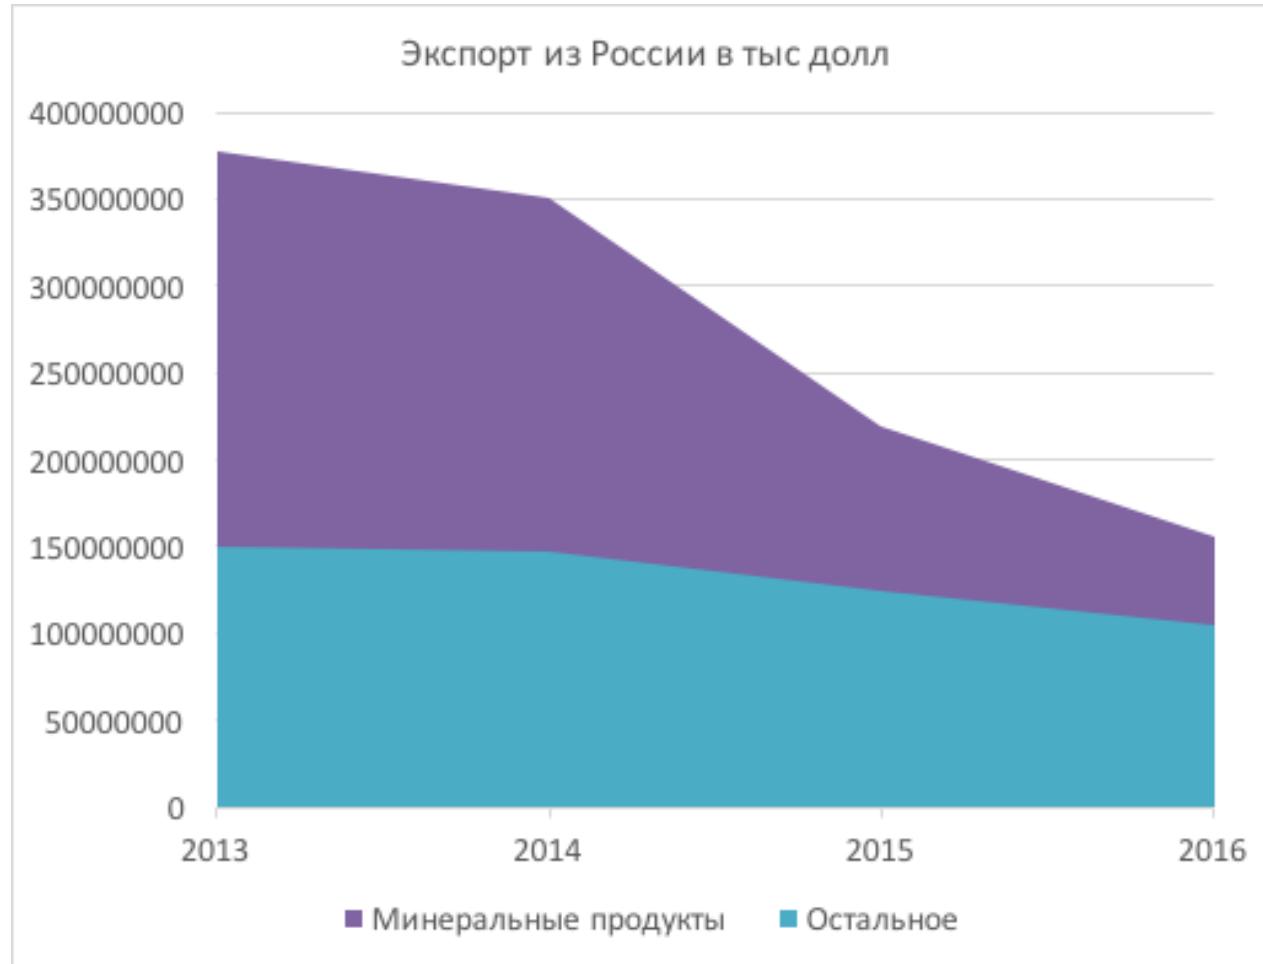

Pumping at full speed

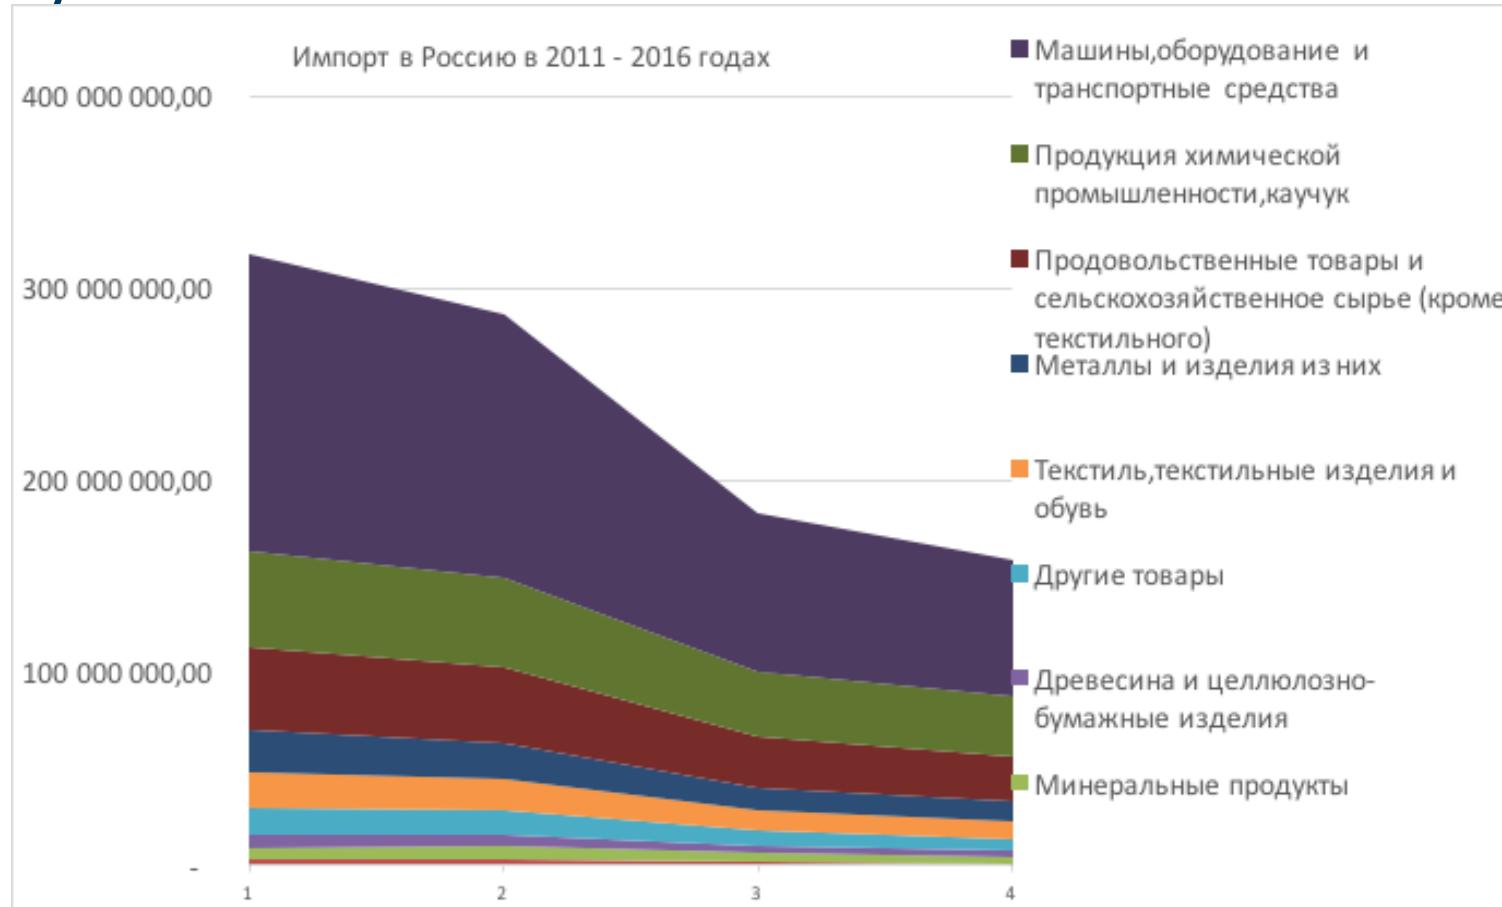

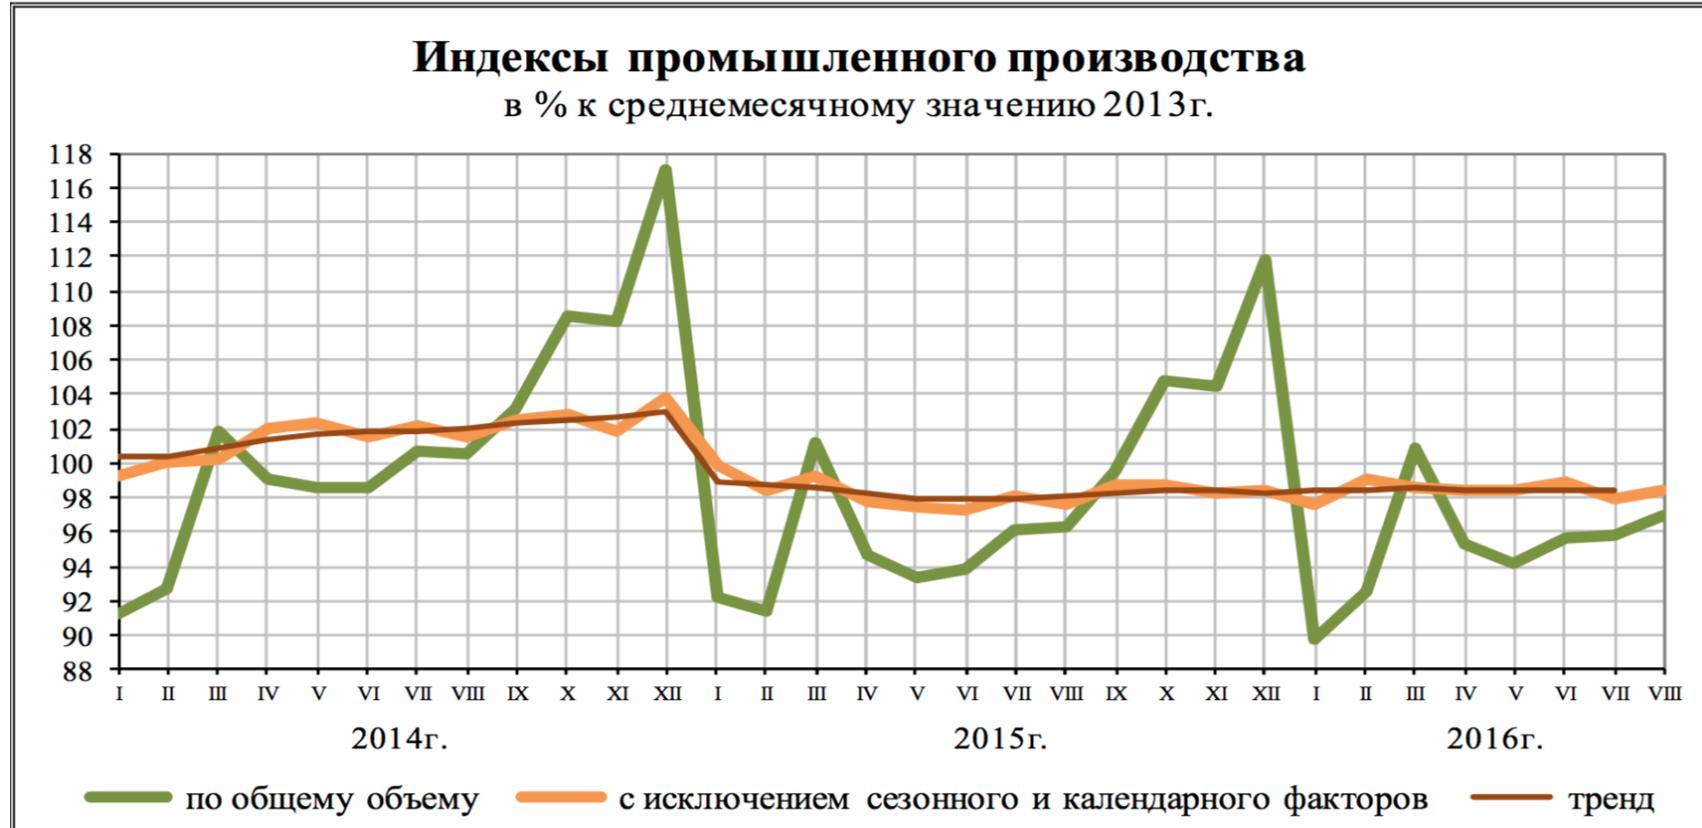

vseonefti.ru

Non-oil exports in decline

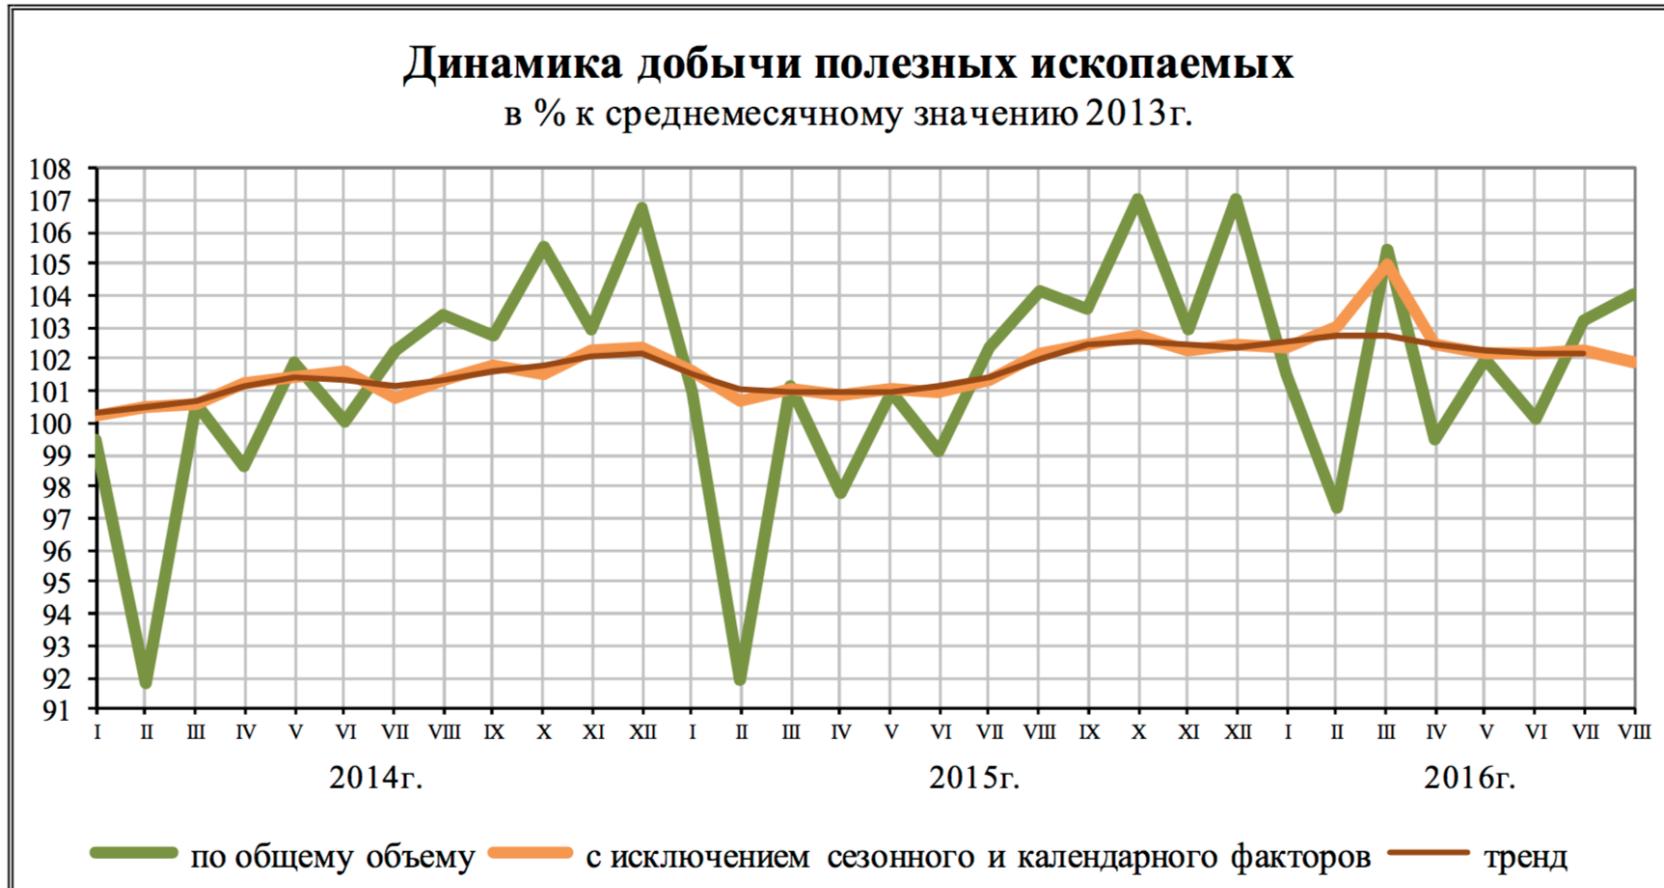

Imports in decline as well, however the delayed demand is about to come

Although mineral resources extraction grows

M2 exceeds inflation – does not help as in the US

Banks mount extra cash balances

Inflation goes down because of the decrease of demand

Russian elites bet on old horses, while next cycle winners will ride new ones

Russian seem-to-be strategy

- Reindustrialization
- Agriculture and food security
- Increase of the role of the state
- Market protectionism and self-sufficiency
- Resource driven economy
- Infrastructure enhancement

Winning ideas

- “Servicization”
- International labor division
- Decrease of the role of the state
- Participation in global economic blocks
- Marketing driven economy
- Education and medicine enhancement

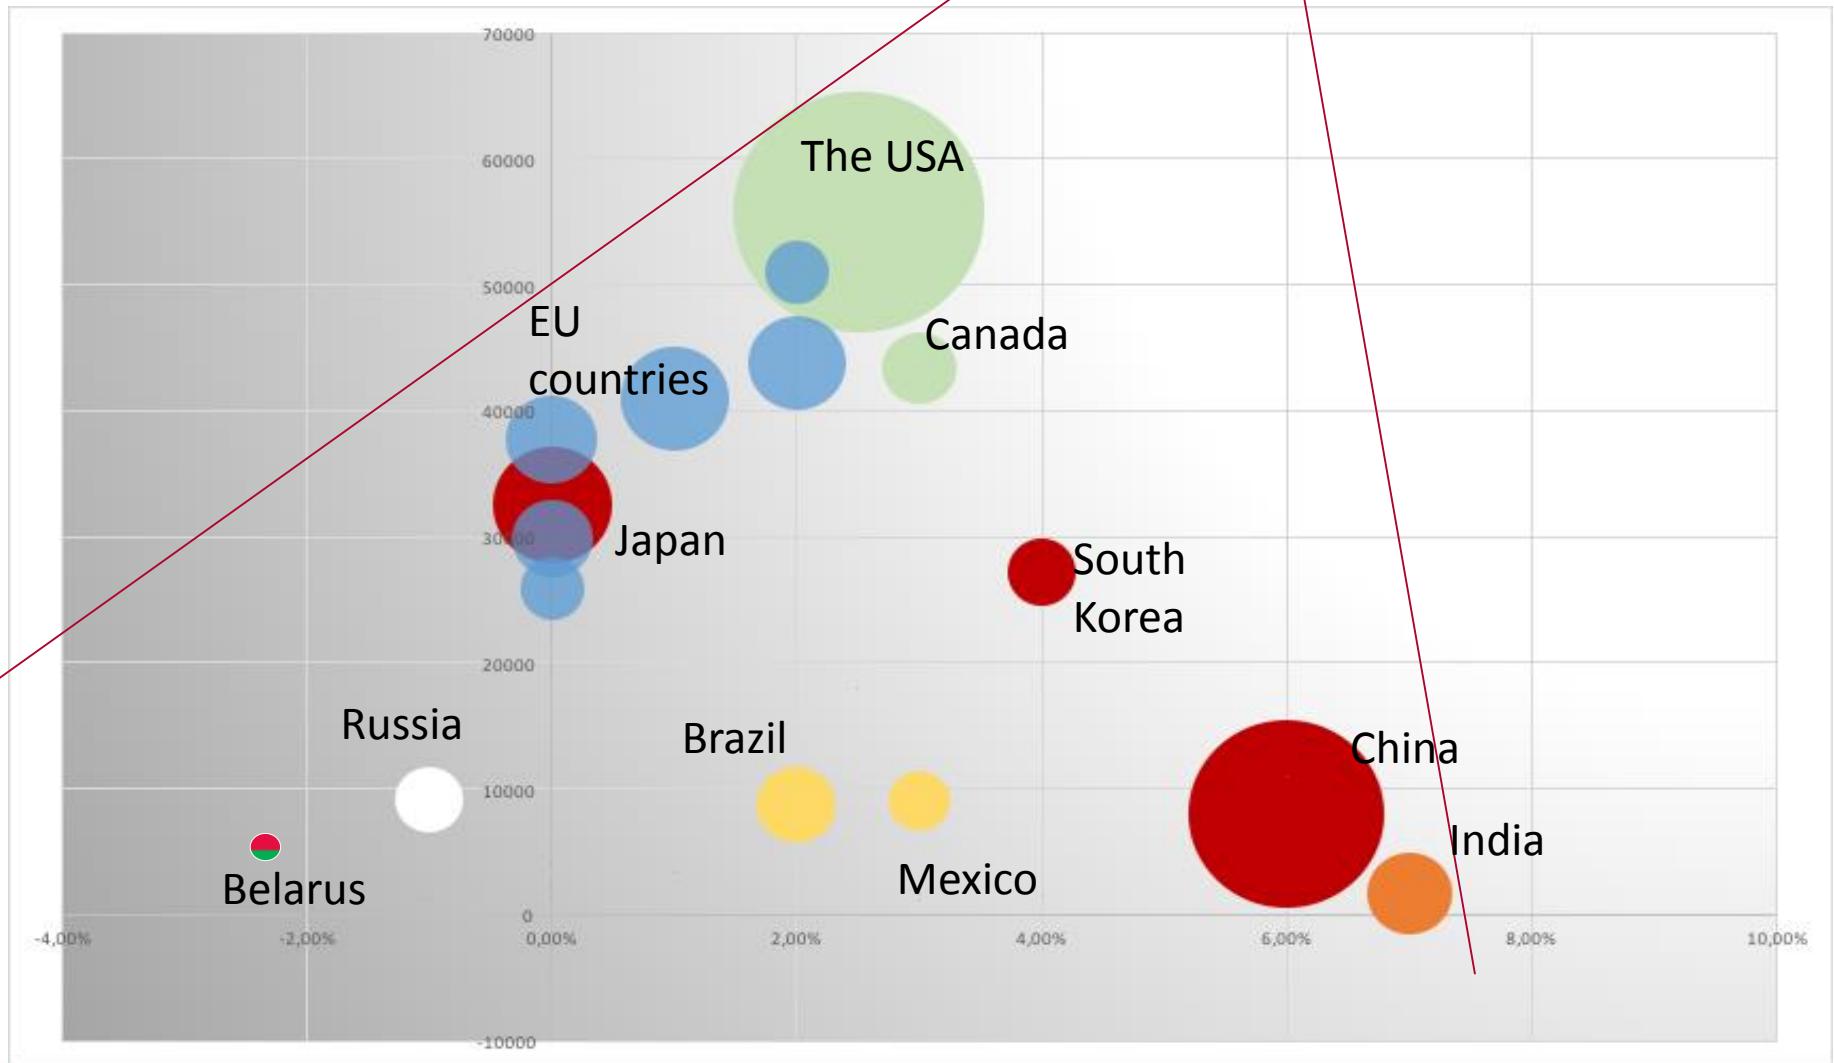

NEW ARGENTINA, 100 YEARS AFTER

Belarus in the global context

Economic radar screen – biggest ones

Belarus at a glance

Parameter	Belarus	World rank	Poland	Russia
GDP per capita, USD	5800	86	12500	9000
Industrial production 2013 – 2016 growth rate	1%	148	4%	-3%

Few ideas for Belarus

- Small is good
- The natural niche – intermediary and transit position between the EU and Russia shall be exploited in full. DAFTA is not suitable, though there are ways around. Still the EU and openness of the market are more important long term
- Diversification of foreign trade is vital and inevitable
- Competition with EU can start with tax regime
- Competition with Russia starts with attractive domiciliation and labor conditions
- Debt is good, but using it for fixed capital accumulation is inefficient
- Services shall grow
- Nothing is bad in securities markets
